## Table of Contents

# Preface

## General Purpose

The purpose of this document is to disclose information related to Xerox® FreeFlow® VI eCompose, regarding product security.

### Note

Customers are responsible for the security of their network and the FreeFlow product. The FreeFlow product does not enforce security for any network environment.

## Target Audience

The target audience for this document is customers who require more security-related information regarding FreeFlow VI eCompose software.

## Disclaimer

To the best of our knowledge, the information contained in this document is accurate as of the publication date and is provided with no warranties. In no event shall Xerox Corporation be liable for any damages resulting from the usage or disregard of the information provided in this document, including direct, indirect, incidental, consequential, loss of business profits, or special damage, even if Xerox Corporation has been advised of the possibility of such damages.

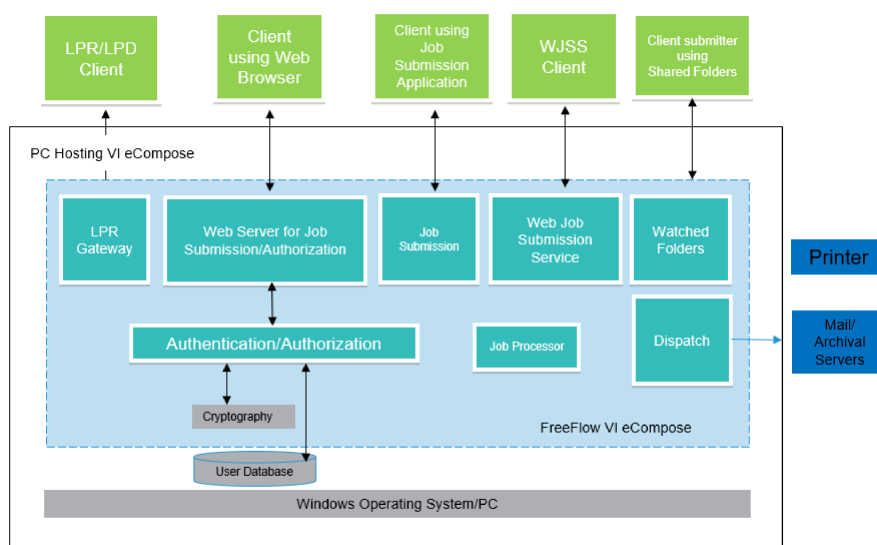

# Product Description

VI eCompose is a client/server application that allows you to generate Adobe PDF documents from VIPP-based variable data applications and forward the PDFs to other processes within the environment. VI eCompose extends the VIPP workflow into electronic distribution and archive by providing the ability to generate Adobe PDF files from the same data files sent to a VIPP-enabled print device. The PDF files, along with information from the data record that produced them, can then be passed to a user-defined process using the VI eCompose Dispatch module. The files can be integrated into processes within the environment, which can include email servers or archive systems. In addition, the VI eCompose Server can forward the data submission file or the Master PDF file to an identified VIPP-enabled print device available in the Printer dialog box on the Windows server for hard copy output.

## System Software Structure

The system software structure for the product is depicted.

## Product Description

# System Access

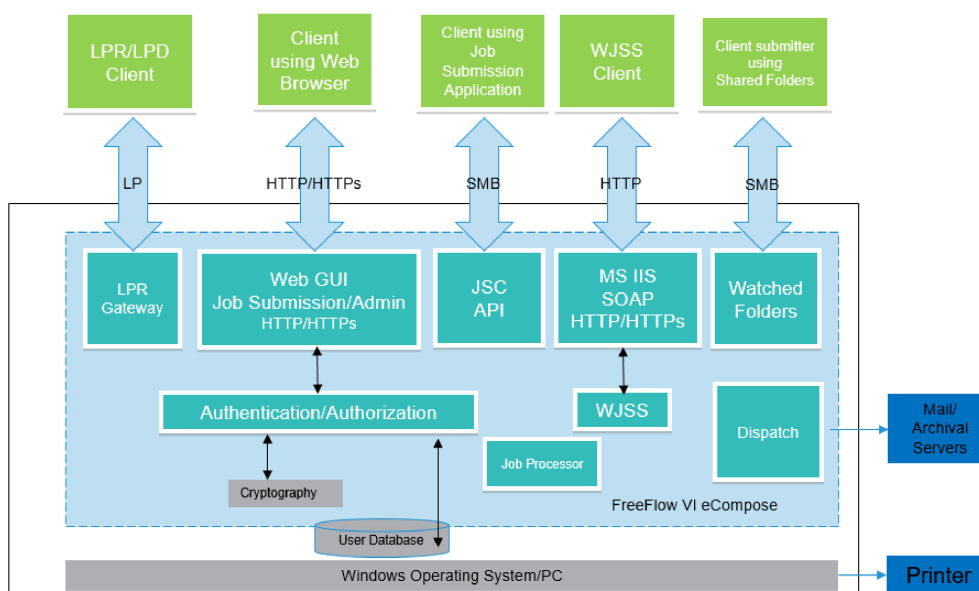

## Network Connections

FreeFlow VI eCompose software requires network connectivity for job submission from clients, and requires a browser for job processing and administration. Security considerations for each network connection are documented in this guide.

### Note

To provide better security protection against vulnerability attacks, Windows Firewall is required. Enable Windows Firewall on the server where VI eCompose is installed, unless your site has its own firewall requirements.

The diagram shows FreeFlow VI eCompose network connections.

## FreeFlow VI eCompose

The FreeFlow VI eCompose server allows clients using a Web browser to submit VIPP jobs and perform administration functions on the server. To enable a Web browser to access the VI eCompose server, start the VI eCompose Web Server or the VI eCompose Secure Web Server on the server.

The VI eCompose Secure Web Server allows communication using HTTPS. Both the VI eCompose Web Server and the Secure Web Server can be configured to use HTTP Basic Authentication. Enabling HTTPS connectivity requires a valid CA certificate installed on the system. For information on configuring the system for HTTPS with SSL and HTTP Basic Authentication, refer to the *FreeFlow VI eCompose User Guide*.

You can submit VIPP jobs using LPR, watched folders, and WJSS. To allow job submissions from LPR clients, FreeFlow VI eCompose relies on enabled services for the Windows TCP/IP Print Server and the Print Spooler.

### Note

The client can retrieve a VIPP job converted to a PDF, which can contain customer data.

**Table 1: Firewall Configuration for FreeFlow VI eCompose**

Port	Protocol or Application	Firewa ll Connection Type
80	HTTP	Inbound <b>Note</b> Port can be changed through a configuration file.
443	HTTPS	Inbound <b>Note</b> Port can be changed through a configuration file.
515	LPR	Inbound

## User Roles

If Basic Authentication is enabled, the FreeFlow VI eCompose Web Server and the FreeFlow VI eCompose Secure Web Server open to a login screen. For system access, users are required to log in to the system.

### Administrator

The administrator has access to the entire system:

- Job Submission/View/Retrieval: Submit Job Dialog, Job Status.
- Change Password
- Administration:
  - User Administration: Add User, Delete User, Add User from Groups, Remove User from Groups: Admin, User, and User Password management.

- Server Administration
- Cluster Administration

### Note

Multiple administrators can log in to the FreeFlow VI eCompose Web server at the same time.

### User

The user has access to the Job Submission/View/Retrieval where they can view the Submit Job Dialog and Job Status.

### Note

Multiple users can log in to the FreeFlow VI eCompose Web Server at the same time.

## User Authentication

When the server is configured for HTTPS, the credentials entered into the browser are encrypted as part of HTTPS communication. If the FreeFlow VI eCompose Web Server is not using HTTPS, no credentials are encrypted. The FreeFlow VI eCompose WebServer supports cryptographic protocols TLS v1.1/1.2.

User passwords are transformed using the hashing algorithm, SHA-2. Passwords are stored locally on the server. Passwords cannot be derived from the hashed string stored on the server.

## Job Submission/View/Retrieval Interface

The Job Submission/View/Retrieval, and Administration User Interface uses the FreeFlow VI eCompose connection for job submission, job view, retrieval, and administration.

For more information, refer to the the Xerox VI eCompose Client.

**Table 2: Firewall Configuration for the Job Submission/View/ Retrieval Interface**

Port	Protocol or Application	Firewall Connection Type
80	HTTP	Inbound
443	HTTPS	Inbound

## Watched Folders

You can encrypt file shares for a local watched folder and for accessing a watched folder. To encrypt files, use the Windows file system or the Windows user account access control.

**Table 3: Firewall Configuration for Watched Folders**

Port	Protocol or Application	Firewall Connection Type
139, 145	SMB	Inbound: Sharing Hot Folders using Windows File Sharing. Outbound: Using Hot Folders on Shared Directories.

## Web Job Submission Service (WJSS)

FreeFlow VI eCompose software allows custom job submission clients to submit many VIPP data files quickly for processing. You can submit jobs to the Web Job Submission Service (WJSS) using IIS or the WJSS Proxy Server provided.

For more information, access the VI eCompose distribution, open the WJSS folder, then refer to the *FreeFlow VI eCompose Web Job Submission Service User Guide*.

### Note

The WJSS service is a Microsoft IIS extension. WJSS and the VI eCompose Web Server or the VI eCompose Secure Web Server cannot run concurrently without configuration.

By default, the software uses port 80 for HTTP, and port 443 for HTTPS. If you run IIS and WJSS concurrently with either the VI eCompose Web Server or the VI eCompose Secure Web Server, configure the servers to use alternate ports. For more information, refer to the *FreeFlow VI eCompose User Guide*.

**Table 4: Firewall Configuration for the WJSS**

Port	Protocol or Application	Firewall Connection Type
80	HTTP	Inbound

# Security

At Xerox, security issues are front and center. As a leader in the development of digital technology, Xerox has demonstrated a commitment to keeping digital information safe and secure. To limit risk, Xerox identifies potential vulnerabilities and proactively addresses them. Xerox strives to provide the most secure software products possible, based on the information and technologies available, while maintaining product performance, value, functionality, and productivity. The components of Xerox FreeFlow VI eCompose are assessed for security compliance, using commercially available vulnerability and penetration scanning tools. Application vulnerabilities are addressed based on results of our internal scans.

Xerox maintains the website <http://www.xerox.com/security> with up-to-date security vulnerability status, white papers, Common Criteria Certification, Intel Security McAfee information, and a portal to submit security questions to Xerox.

## Virus Protection

Xerox takes special precautions to ensure that software is shipped free from computer virus contamination. It is recommended that you invest in a virus-detection software application accepted by the PC industry. To protect your system from viruses, it is imperative that virus-detection software is kept up to date.

To improve performance, it is recommended that you exclude the FreeFlow Core and SQL Server installation directories from anti-virus scans.

You can exclude the following FreeFlow VI eCompose folders from anti-virus scanning:

X:\xvtp\bin: The directory and subdirectories where X is the drive where the software is installed.

# 5

## Software Update

It is recommended that customers keep up to date all software products installed on the FreeFlow VI eCompose server. At least once a month, perform a Microsoft Windows Update.

For FreeFlow VI eCompose software updates, click the link:
