Known Issues

The PPD for the 64-bit version of Windows XP or Windows Server 2003 allows you to use the standard Windows printer driver to send jobs to the Fiery. You can access the PPD options when you print from an application by clicking Advanced in the Printer Properties window. The PPD options are available under Printer Features.

Some print options are not available or are only partially functional, including:

- Tray Alignment
- Scale
- Print Mode
- Group Name
- Group Password
- Description

- Notes
- Orientation
- FreeForm

Constraints between two or more settings are indicated with yellow warning icons, but you are not prevented from printing a job with settings that conflict.

Two-Way Communication is not available when using this PPD with the standard Windows printer driver. You must manually configure the printer driver with any installed options.
