☐ Limitations

[Prerequisites]

Please note that this print driver operates on a computer running Microsoft(R) Windows(R) XP Professional x64 Edition or Microsoft(R) Windows Server(TM) 2003 x64 Editions or Microsoft(R) Windows Vista English version.

(Please confirm the recommended system configuration of the operating system such as the supported processor and memory capacity.)

* This driver provides the basic print functions based on the prerequisites in Readme.txt. Please note that it is not guaranteed that the functionality of this print driver and its functional compatibility on 32-bit OS environment is the same as the print driver in the past.

* If a B/W document is printed on a color printer, please set the print driver setting to B/W. If printing is performed using color setting, it will be counted as a color print.

* When printing an odd-page document in duplex, a blank page may be added to the last page of the document depending on the operating system (thereafter OS). In this case, display the properties dialog box from the printer icon and uncheck the "Enable advanced printing features" check box on the "Advanced" tab. However, note that reverse order printing and booklet printing will be unavailable when this check box is unchecked. Depending on the application used by the customer, blank pages for page adjustment will be inserted automatically according to the conditions like the number of copies specified regardless of the type of OS. This operation cannot be prevented as it is part of the specification of the application. The blank inserts by the OS or application will be counted.

* This driver does not support the authentication function. As a result, printing is unavailable if authentication is required from the printer.

* This driver does not support User ID function. Therefore, counting of print jobs is unavailable using DocuHouse.

* Application prints such as secure print, save to mailbox , delay print are not supported.

* Direct FAX function is not supported.

* If this print driver is used in a shared printer, it is necessary to make sure that this mini driver is operating on both the server and client.

* It is necessary that the client using the shared printer fulfill the prerequisite. (It cannot be operated on 32-bit OS.)

* This print driver does not support Citrix MetaFrame(R).

* Printing may not be available using this print driver depending on the memory capacity of the printer. If the printing resolution drops and the page count are huge, you can try to print the document by subsets or increase the memory quota of the printer.

* This print driver will take a longer processing time compared to the 32-bit full function print driver.

☐Known Problems

None.

☐ WHQL Certified

Not certified.
