

Xerox[®] DocuColor[®] 8080 Digital Press

Hints and Tips for Ensuring Optimal Press Performance

Daily maintenance is the key

To ensure that your press delivers the highest image and color quality, check daily that you:

- Clean the corotrons every day and at the beginning of a color-critical job.
Important: Do not wait until you see a defect to clean the corotrons; Use preventative maintenance by cleaning the corotrons daily.
- Perform print server color calibration every day. Calibration is the foundation of good color management and the single most important thing you can do to maintain on-going quality.
- Create profiles for each stock that you use in color workflows. Then make sure that you select the correct profile for the media being used in each job. Update profiles every one or two months and after print engine service. Note that you do not need to create separate profiles when paper size is the only difference in the media.
- As you introduce a new stock type, create a new color profile.
- Different paper types can greatly impact image quality. Use the Xerox Recommended Materials List (RML) to ensure the best quality. You can obtain a copy of the RML at www.xerox.com. On the main page, enter *8080 RML* in the search box and click *search*.

Please ask your Xerox Analyst for a copy of the calibration and profiling procedures for your server.
