

Relay Communications

Relay Communication allows you to send documents from your fax machine (initiating station) to one or more fax machines (relay stations), which further sends them to additional fax machines (end stations). If you have several end stations in one or more regional areas you can save time and phone expense by setting up a relay system.

Activating the Relay Feature

Relay communication is an optional feature that is compatible with other Xerox Document WorkCentre's Pro 635, 645, 657 and 745 machines. The feature must be activated by a Service Representative; please contact your local Xerox Service Representative to activate the Relay feature.

When the Relay Communications feature is activated, the number of programmable Speed Dial locations is reduced from 240 to 200.

Please be advised that activation of the Relay Communications feature results in a "full memory clear". All user programmed information is erased, including the phonebook directories. It is recommended that the relay feature be activated prior to programming the machine.

If you have programmed information entered in memory, you should print out the phonebook reports, a Settings report and documents in memory since the information is cleared when the Relay feature is enabled. This information can assist you in reprogramming the machine.
