# LPRQNAME

---

|                    |                                                                                                                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the queue name on this printer that will receive print jobs. For the default queue name of other printers and interface devices, refer to the applicable vendor documentation.                             |
| <b>Scope</b>       | Affects processing of all types of data streams sent to any printer using the TCP/LPR or TCP/IP protocols.                                                                                                           |
| <b>Syntax</b>      | <p>LPRQNAME=<i>queue-name</i></p> <p>where</p> <p><i>queue-name</i>      The 1- to 50-character queue name on this printer. The queue name can include alphanumeric, national (\$, #, @), or special characters.</p> |

---

**NOTE:** Spaces are not valid characters within a queue name.

| <b>Description</b>         | <p>Indicates whether overlays will be consolidated.</p> <p>Include MERGEOVL=Y in your printer profile if you want to merge all the overlays in a copy group the first time that the copy group is used in a document. Each overlay in the copy group is converted, then the individual converted overlays are consolidated into a single .FRM. The .FRM is not saved in the native form library, but will be reused each time the copy group is called. At completion of the document, the .FRM is deleted from the printer. Depending on the complexity of the document, enabling this feature may improve your printer's performance.</p> <p>All of the inline images included in the overlays are consolidated into a single image. The consolidated image can be reused each time the copy group is called. At completion of the document, the consolidated image is deleted from the printer.</p> <p>If you include MERGEOVL=N in your printer profile, the converted overlays are not consolidated. Instead, only the first converted overlay is processed as a .FRM; subsequent converted overlays are merged with variable data on the page.</p> <p>If you omit this parameter, the value specified in your XINSXOSF member is used.</p> |
| <b>Scope</b>               | Affects processing of AFP documents, that include multiple overlays in a copy group, sent to centralized printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Default</b>             | The MERGEOVL initialization parameter value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Example</b>             | MERGEOVL=Y                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Overrides</b>           | This parameter overrides the MERGEOVL initialization parameter; it can be overridden by the MERGEOVL extended JCL keyword.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Related information</b> | If you specify MERGEOVL=Y, the COLORIMG extended JCL keyword has no affect on images within forms. However, other image resources will be affected. For more information, see the COLORIMG extended JCL keyword.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## METAJDE

---

|                    |                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Defines the JDE member in the JDL dataset used when converting documents to Metacode. Note that the JDE must reference a VOLUME CODE=NONE to be effective.                                                                     |
| <b>Scope</b>       | Affects processing of page-formatted and AFP data streams sent to centralized printers.                                                                                                                                        |
| <b>Syntax</b>      | METAJDE= <i>jde-name</i><br><br>where<br><i>jde-name</i> The 1- to 6-character JDE name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character. |
| <b>Default</b>     | The METAJDE initialization parameter value.                                                                                                                                                                                    |
| <b>Example</b>     | METAJDE=PGMODE                                                                                                                                                                                                                 |
| <b>Overrides</b>   | This parameter overrides the METAJDE initialization parameter; it can be overridden by the JDE extended JCL keyword.                                                                                                           |

## METAJDL

---

|                    |                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the JDL to be used for AFP-to-Metacode jobs directed to centralized printers.                                                                                                                                       |
| <b>Scope</b>       | Affects processing of page-formatted and AFP data streams sent to centralized printers.                                                                                                                                        |
| <b>Syntax</b>      | METAJDL= <i>jdl-name</i><br><br>where<br><i>jdl-name</i> The 1- to 6-character JDL name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character. |
| <b>Default</b>     | The METAJDL initialization parameter value.                                                                                                                                                                                    |
| <b>Example</b>     | METAJDL=HIP871                                                                                                                                                                                                                 |
| <b>Overrides</b>   | This parameter overrides the METAJDL initialization parameter; it can be overridden by the JDL extended JCL keyword.                                                                                                           |

## MSGFEED

---

|                            |                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Identifies the tray from which paper is fed when printing messages that are issued by XPAF during document processing. This parameter is required only if the PRINTMSG initialization or printer profile parameter is a value other than N.                                                                                                                  |
| <b>Scope</b>               | Affects processing of line-mode and DJDE data streams sent to centralized printers.                                                                                                                                                                                                                                                                          |
| <b>Syntax</b>              | $\text{MSGFEED} = \left\{ \begin{array}{c} \text{MAIN} \\ \text{AUX} \\ \text{stock-ref} \end{array} \right\}$ <p>where</p> <p>MAIN            Uses the main paper tray.</p> <p>AUX            Uses the auxiliary paper tray.</p> <p><i>stock-ref</i>    The 1- to 6-character stock reference name. Uses the tray that contains a specified paper type.</p> |
| <b>Default</b>             | The MSGFEED initialization parameter value.                                                                                                                                                                                                                                                                                                                  |
| <b>Example</b>             | MSGFEED=MAIN                                                                                                                                                                                                                                                                                                                                                 |
| <b>Overrides</b>           | This parameter overrides the MSGFEED initialization parameter.                                                                                                                                                                                                                                                                                               |
| <b>Related information</b> | See also the PRINTMSG initialization and printer profile parameters. For AFP data streams, refer to the AFPMSGDS initialization and printer profile parameters.                                                                                                                                                                                              |

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies whether AFP resources (converted overlays and images) are stored in native libraries.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Scope</b>       | Affects processing of AFP data streams sent to centralized printers.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Syntax</b>      | $\text{NOSTORE} = \left\{ \begin{array}{c} \text{Y} \\ \text{N} \end{array} \right\}$ <p>where</p> <p>Y    Does not store AFP resources in the native libraries. Instead, they are converted and downloaded for every job. This revises the resources without having to use the REVxxxxx extended JCL keywords.</p> <p>      Downloaded resources are deleted from the printer at the end of the job.</p> <p>N    Stores AFP resources in the native libraries.</p> |
| <b>Default</b>     | The NOSTORE initialization parameter value.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Example</b>     | NOSTORE=Y                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Overrides</b>   | This parameter overrides the NOSTORE initialization parameter.                                                                                                                                                                                                                                                                                                                                                                                                      |

# OFFSTACK

---

|                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>                                                                                                                                                                                                                             | Indicates whether offset stacking is enabled or disabled at the printer. For job types other than page-formatted or AFP, offsets occur when job separator or dataset separator pages are inserted.                                                                                                                                                     |
| <b>Scope</b>                                                                                                                                                                                                                                   | Affects processing of all types of data streams sent to decentralized printers that support offset stacking.                                                                                                                                                                                                                                           |
| <b>Syntax</b>                                                                                                                                                                                                                                  | $\text{OFFSTACK} = \left\{ \begin{array}{l} \text{YES} \\ \text{NO} \end{array} \right\}$ <p>where</p> <p>YES      Offset stacking by job is enabled at the printer. Offset stacking will occur between datasets only if separator pages are contained within the job.</p> <p>NO        Offset stacking has been manually disabled at the printer.</p> |
| <hr/> <div> <b>NOTE:</b> For page-formatted and AFP jobs, you must specify OFFSTACK=NO if you want to use the COPYMARK=JOB JES printer parameter.</div> <hr/> |                                                                                                                                                                                                                                                                                                                                                        |
| <b>Default</b>                                                                                                                                                                                                                                 | The OFFSTACK initialization parameter value.                                                                                                                                                                                                                                                                                                           |
| <b>Example</b>                                                                                                                                                                                                                                 | OFFSTACK=NO                                                                                                                                                                                                                                                                                                                                            |
| <b>Overrides</b>                                                                                                                                                                                                                               | This parameter overrides the OFFSTACK initialization parameter.                                                                                                                                                                                                                                                                                        |

## PAGEDEF

---

|                            |                                                                                                                                                                                                                                            |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | For XOSF processing, names the default PAGEDEF member used for AFP-to-Metacode conversion if a PAGEDEF for this printer is not specified in the extended JCL. If you use AFP, make sure the XPAF value for PAGEDEF matches your AFP value. |
| <b>Scope</b>               | Affects processing of AFP data streams sent to this printer.                                                                                                                                                                               |
| <b>Syntax</b>              | PAGEDEF= <i>member-name</i><br><br>where<br><i>member-name</i> The 1- to 6-character PAGEDEF member name. The name can include alphanumeric or national (\$, #, @) characters.                                                             |
| <b>Default</b>             | The PAGEDEF initialization value.                                                                                                                                                                                                          |
| <b>Example</b>             | PAGEDEF=X06483                                                                                                                                                                                                                             |
| <b>Overrides</b>           | You can override this parameter by using the PAGEDEF IBM JCL keyword.                                                                                                                                                                      |
| <b>Related information</b> | See also the FCB and SYSFCB initialization parameters, the FCB printer profile parameter, and the FCB IBM JCL keyword.                                                                                                                     |

## PAGEFORMLIB

---

|                    |                                                                                                                                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Names the DD statement that specifies the partitioned dataset which contains the page formats for this printer.                                                                                                                  |
| <b>Scope</b>       | Affects processing of page-formatted data streams sent to all types of printers.                                                                                                                                                 |
| <b>Syntax</b>      | PAGEFORMLIB= <i>ddname</i><br><br>where<br><i>ddname</i> The 1- to 8-character DD name. The DD name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character. |
| <b>Default</b>     | The PGFRMDD initialization parameter value.                                                                                                                                                                                      |
| <b>Example</b>     | PAGEFORMLIB=TSTPFORM                                                                                                                                                                                                             |
| <b>Overrides</b>   | This parameter overrides the PGFRMDD initialization parameter.                                                                                                                                                                   |

| <i>paper-name</i>  | Any 1- to 6-character alphanumeric, user-defined name from a paper name table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |    |                        |    |                       |    |                      |    |                      |       |                   |        |                   |        |                   |      |                  |        |                    |                   |                                                                                |

You also can specify PAPERSIZ to match the exact dimensions of any corresponding paper size loaded in your printer. To do so, enter the values for PAPERSIZ as:

PAPERSIZ=(*width,height,unit-measure*)

where

|                     |                                                 |
|---------------------|-------------------------------------------------|
| <i>width</i>        | The paper width (x axis).                       |
| <i>height</i>       | The paper height (y axis).                      |
| <i>unit-measure</i> | The unit of measure, specified by one of these: |
| CM                  | Centimeters                                     |
| DOTS                | 300 dpi                                         |
| IN                  | Inches                                          |
| MM                  | Millimeters                                     |
| XDOTS               | 600 dpi                                         |

If you specify a decimal value, use the letter P to identify the decimal point. Enter a valid value using one of these formats:

000P01 to 999P99 (for a decimal number)  
000001 to 999999 (for a whole number)

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>   | The PAPERSIZ initialization parameter value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Examples</b>  | <p>PAPERSIZ=LEGAL</p> <p>PAPERSIZ=(9P84,13P9,IN)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Overrides</b> | <p>This value overrides the value specified in the PAPERSIZ or PAPERHIT/PAPERWID/PAPERUM initialization parameters. For a selected document, you can override this parameter by using the PAPERSIZ extended JCL keyword.</p> <p>If you have modified the dimensions for a paper name in a paper name table, those dimensions will override the default dimensions shown in this Syntax section. Refer to <a href="#">Section Three: Managing Resources with XPAF</a> for more information on paper-related table processing.</p> |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Related information</b> | <p>If you specify a paper name that is defined in a paper name table, make sure that paper name table has been specified in the PAPNAMTB initialization parameter, printer profile parameter, or extended JCL keyword. If you specify a paper name that is not defined in a paper name table, XPAF uses the values shown in this Syntax section to determine the paper size. If the paper name is not listed in the Syntax section, the paper size defaults to 8.5 by 11 inches.</p> <p>For AFP data streams, XPAF uses the entries in the currently active varying paper size table to determine which tray select command to issue to decentralized and PCL-capable printers. If a valid varying paper size table is not specified, XPAF issues a tray select command based on three criteria: the AFP bin number within the copy group, the paper name specified in PAPERSIZ, and the printer type. Refer to <a href="#">Section Three: Managing Resources with XPAF</a> for more information on paper-related table processing.</p> |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p>Identifies the paper name table used by XPAF to determine the physical paper size dimensions that correlate to a specified paper name. The paper name can be specified in the varying paper size tables, in the cluster mapping tables, or by the PAPERSIZ initialization parameter, printer profile parameter, and extended JCL keyword.</p> <p>This table resides in the library specified in the XOSF start-up proc DD statement named by the PAPTBLDD initialization or printer profile parameter.</p> |
| <b>Scope</b>               | Affects processing of all types of data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Syntax</b>              | <p>PAPNAMTB=<i>table-name</i></p> <p>where</p> <p><i>table-name</i> The 1- to 16-character table name. The name can include alphanumeric or national (\$, #, @) characters.</p>                                                                                                                                                                                                                                                                                                                               |
| <b>Default</b>             | The PAPNAMTB initialization parameter value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Example</b>             | PAPNAMTB=PNAME01                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Overrides</b>           | This parameter overrides the PAPNAMTB initialization parameter; it can be overridden by the PAPNAMTB extended JCL keyword.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Related information</b> | See also the PAPERSIZ initialization parameter, printer profile parameter, and extended JCL keyword. Refer to <a href="#">Section Three: Managing Resources with XPAF</a> for more information on paper-related table processing.                                                                                                                                                                                                                                                                             |

---

**NOTE:** XPAF cannot verify that the paper size specified matches the paper actually loaded on the printer.

| DEFAULT                    | Converts the document to the default printer command language specified by the PCL printer profile parameter.                                                                                                                                                                                                                                                                                                                                                           |         |                                                                                                               |     |                                       |      |                                                                                |
| GEN                        | Converts the document to PCL5 format.                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |                                                                                                               |     |                                       |      |                                                                                |
| PASS                       | Indicates that the document is a pass-through job; no conversion is performed.                                                                                                                                                                                                                                                                                                                                                                                          |         |                                                                                                               |     |                                       |      |                                                                                |
| <b>Default</b>             | DEFAULT                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |                                                                                                               |     |                                       |      |                                                                                |
| <b>Example</b>             | PCLREQ=GEN                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |                                                                                                               |     |                                       |      |                                                                                |
| <b>Overrides</b>           | You can override this parameter by using the PCLREQ extended JCL keyword.                                                                                                                                                                                                                                                                                                                                                                                               |         |                                                                                                               |     |                                       |      |                                                                                |
| <b>Related information</b> | If you specify PCL=PCL5 in your printer's profile and you have not specified a value for PCLREQ in either your printer's profile or extended JCL, XPAF will set PCLREQ to a value of GEN.                                                                                                                                                                                                                                                                               |         |                                                                                                               |     |                                       |      |                                                                                |

## PDLLIB

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Names the DD statement that specifies the native library that contains JSL files, and cataloged member files.                                                                                                                                                                                                                                                                                            |
| <b>Scope</b>               | Affects processing of all types of data streams sent to centralized printers, and processing of DJDE data streams sent to decentralized and PCL-capable printers.                                                                                                                                                                                                                                        |
| <b>Syntax</b>              | PDLLIB= <i>ddname</i><br>where<br><i>ddname</i> The 1- to 8-character DD name. The DD name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character.                                                                                                                                                                                  |
| <b>Default</b>             | The PDLLIB initialization parameter value.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Example</b>             | PDLLIB=TESTPDL                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Overrides</b>           | This parameter overrides the PDLLIB initialization parameter.                                                                                                                                                                                                                                                                                                                                            |
| <b>Related information</b> | When you update PDL, you must update it on both the host and the printer. Then, recompile the PDL on the printer and load the updated host member to the native library specified in the DD statement named by this parameter. Refer to <a href="#">Section Three: Managing Resources with XPAF</a> and <a href="#">Section Four: Printing Documents with XPAF</a> for more information on updating PDL. |

## PDLOBJ

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Enables downloading of PDL object files (JDL, PDE, CME, STK, TST, LIB, and IDR) to centralized printers when referenced within a print job. These resources must first be loaded into the PDLLIB with XOAF.                                                                                                                                                                                                                                        |
| <b>Scope</b>               | Affects processing of all types of data streams sent to centralized printers.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Syntax</b>              | PDLOBJ= $\left\{ \begin{array}{l} \text{YES} \\ \text{NO} \end{array} \right\}$<br>where<br>YES      Enables PDL resource management.<br>NO      Disables PDL resource management.                                                                                                                                                                                                                                                                 |
| <b>Default</b>             | No                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Related information</b> | See also the AUTOREV initialization and printer profile parameters.<br>This parameter is independent of the FEATURE=NODOWNLOAD parameter. PDL objects will be downloaded based on the setting of the PDLOBJ parameter, not the FEATURE=DOWNLOAD/NODOWNLOAD parameter.<br>Refer to <a href="#">Section Three: Managing Resources with XPAF</a> and <a href="#">Section Four: Printing Documents with XPAF</a> for more information on updating PDL. |

## PDLOLIST

---

|                            |                                                                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Names the list in the LIBRARY dataset for the PDL objects that are resident on the printer. This list will be maintained if you have specified PDLOBJ=Y in your printer profile. |
| <b>Scope</b>               | Affects processing of all types of data streams sent to centralized printers.                                                                                                    |
| <b>Syntax</b>              | PDLOLIST=list-name<br>where<br>list-name is the 1- to 20-character alphanumeric list name.                                                                                       |
| <b>Default</b>             | PDLOunit                                                                                                                                                                         |
| <b>Example</b>             | PDLOLIST=MYPDLOBJLIST                                                                                                                                                            |
| <b>Related information</b> | See also the FEATURE, LIBRARY, PDLOBJ and UNIT printer profile parameters.                                                                                                       |

## PFONTLIB

---

|                    |                                                                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Names the DD statement that specifies the PCL font library used to store fonts that have been dynamically converted to PCL format.                                                                                    |
| <b>Scope</b>       | Affects processing of DJDE, XES, page-formatted, and AFP data streams sent to PCL-capable printers.                                                                                                                   |
| <b>Syntax</b>      | PFONTLIB=ddname<br><br>where<br><i>ddname</i> The 1- to 8-character DD name. The DD name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character. |
| <b>Default</b>     | The PFONTLIB initialization parameter value.                                                                                                                                                                          |
| <b>Example</b>     | PFONTLIB=PCLFONTS                                                                                                                                                                                                     |
| <b>Overrides</b>   | This parameter overrides the PFONTLIB initialization parameter.                                                                                                                                                       |

## PFORMLIB

---

|                    |                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Names the DD statement that specifies the PCL form library used to store forms that have been dynamically converted to PCL format.                                                                                            |
| <b>Scope</b>       | Affects processing of DJDE, XES, page-formatted, and AFP data streams sent to PCL-capable printers.                                                                                                                           |
| <b>Syntax</b>      | PFORMLIB= <i>ddname</i><br><br>where<br><i>ddname</i> The 1- to 8-character DD name. The DD name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character. |
| <b>Default</b>     | The PFORMLIB initialization parameter value.                                                                                                                                                                                  |
| <b>Example</b>     | PFORMLIB=PCLFORMS                                                                                                                                                                                                             |
| <b>Overrides</b>   | This parameter overrides the PFORMLIB initialization parameter.                                                                                                                                                               |

## PGXSCALE

---

|                    |                                                                                                                                                                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the percentage that a page, converted to PDF or PostScript, should be scaled in the horizontal (x direction). A value greater than 100 will cause pages to be displayed larger than the original. A value less than 100 will cause pages to display smaller than the original. |
| <b>Scope</b>       | Affects processing of DJDE, XES, page-formatted, and AFP data streams sent to PDF or PostScript.                                                                                                                                                                                         |
| <b>Syntax</b>      | PGXSCALE= <i>nnn.nn</i><br><br>where<br><i>nnn.nn</i> is the percentage, to two decimal places, to which to scale the page.                                                                                                                                                              |
| <b>Default</b>     | PGXSCALE=100.00                                                                                                                                                                                                                                                                          |
| <b>Example</b>     | PGXSCALE=98.75                                                                                                                                                                                                                                                                           |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                    |

# PGXSHIFT

---

|                    |                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the number of dots (at 300 dots per inch) to shift a page, converted to PCL, horizontally (x direction).                                              |
| <b>Scope</b>       | Affects processing of DJDE, XES, page-formatted, and AFP data streams sent to PCL-capable printers.                                                             |
| <b>Syntax</b>      | PGXSHIFT= <i>value</i><br>where<br><i>value</i> The number of dots to shift the data in the x direction. May be specified as a negative number.                 |
| <b>Default</b>     | PGXHIFT=0                                                                                                                                                       |
| <b>Example</b>     | PGXSHIFT=10                                                                                                                                                     |
| <b>Overrides</b>   | The PGXSHIFT value in the printer profile table can be overridden by specifying PGXSHIFT in the XJCF simulation table entry that is in effect for the document. |

# PGYSCALE

---

|                    |                                                                                                                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the percentage that a page, converted to PDF or PostScript, should be scaled in the vertical (y direction). A value greater than 100 will cause pages to be displayed larger than the original. A value less than 100 will cause pages to display smaller than the original. |
| <b>Scope</b>       | Affects processing of DJDE, XES, page-formatted, and AFP data streams sent to PDF or PostScript.                                                                                                                                                                                       |
| <b>Syntax</b>      | PGYSCALE= <i>nnn.nn</i><br>where<br><i>nnn.nn</i> is the percentage, to two decimal places, to which to scale the page.                                                                                                                                                                |
| <b>Default</b>     | PGYSCALE=100.00                                                                                                                                                                                                                                                                        |
| <b>Example</b>     | PGYSCALE=98.75                                                                                                                                                                                                                                                                         |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                  |

## PGYSHIFT

---

|                    |                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the number of dots (at 300 dots per inch) to shift a page, converted to PCL, vertically (y direction).                                                |
| <b>Scope</b>       | Affects processing of DJDE, XES, page-formatted, and AFP data streams sent to PCL-capable printers.                                                             |
| <b>Syntax</b>      | PGYSHIFT= <i>value</i><br>where<br><i>value</i> The number of dots to shift the data in the x direction. May be specified as a negative number.                 |
| <b>Default</b>     | PGYSHIFT=0                                                                                                                                                      |
| <b>Example</b>     | PGYSHIFT=-10                                                                                                                                                    |
| <b>Overrides</b>   | The PGYSHIFT value in the printer profile table can be overridden by specifying PGYSHIFT in the XJCF simulation table entry that is in effect for the document. |

## PIMAGELIB

---

|                    |                                                                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Names the DD statement that specifies the PCL image library used to store images that have been dynamically converted to PCL format.                                                                                       |
| <b>Scope</b>       | Affects processing of DJDE, XES, page-formatted, and AFP data streams sent to PCL-capable printers.                                                                                                                        |
| <b>Syntax</b>      | PIMAGELIB= <i>ddname</i><br>where<br><i>ddname</i> The 1- to 8-character DD name. The DD name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character. |
| <b>Default</b>     | The PIMAGELIB initialization parameter value.                                                                                                                                                                              |
| <b>Example</b>     | PIMAGELIB=PCLIMGS                                                                                                                                                                                                          |
| <b>Overrides</b>   | This parameter overrides the PIMAGELIB initialization parameter.                                                                                                                                                           |

## PORTFONT

---

|                    |                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the default portrait font defined on the printer. This value is used for AFP-to-XES conversions in a dummy font selection to invoke the correct page orientation at the beginning of a document. For decentralized printers in XES mode, the font must be resident on the printer.                                                             |
| <b>Scope</b>       | Affects processing of all types of data streams sent to all types of printers.                                                                                                                                                                                                                                                                           |
| <b>Syntax</b>      | <p>PORTFONT=<i>font-name</i></p> <p>where</p> <p><i>font-name</i> For centralized printers, the 1- to 6-character font name. The name can include alphanumeric or national (\$, #, @) characters.</p> <p>For decentralized and PCL-capable printers and PDF devices, the 1- to 20-character font name. The name can include alphanumeric characters.</p> |
| <b>Default</b>     | P0612A                                                                                                                                                                                                                                                                                                                                                   |
| <b>Example</b>     | PORTFONT=Titan10iso-P                                                                                                                                                                                                                                                                                                                                    |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                                                                    |

## PRINTMSG

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Indicates whether messages issued by XPAF while processing a document are printed. If you print the messages, they are printed following the last page of the document and before the trailer page.                                                                                                                                                                                                             |
| <b>Scope</b>               | Affects processing of all types of data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                  |
| <b>Syntax</b>              | <p>PRINTMSG=<i>msgcode</i></p> <p>where <i>msgcode</i> is</p> <p>Y Prints all messages.</p> <p>N Does not print any error messages.</p> <p>I Prints messages with message types I, W, A, E, F.</p> <p>W Prints messages with message types W, A, E, F.</p> <p>A Prints messages with message types A, E, F.</p> <p>E Prints messages with message types E, F.</p> <p>F Prints messages with message type F.</p> |
| <b>Default</b>             | The PRINTMSG initialization parameter value.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Example</b>             | PRINTMSG=E                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Overrides</b>           | This parameter overrides the PRINTMSG initialization parameter.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Related information</b> | See also the MSGFEED initialization and printer profile parameters.                                                                                                                                                                                                                                                                                                                                             |

# REVOPSEG

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies whether page segments will be revised when an overlay referring to them is revised.<br>To use this keyword with an AFP data stream, you must:<br>Resubmit the job using the appropriate REVxxxxx keywords in the extended JCL.                                                                                                                                                                                                                                                                    |
| <b>Scope</b>       | Affects processing of AFP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Syntax</b>      | $\text{REVOPSEG} = \left\{ \begin{array}{c} \text{Y} \\ \text{N} \end{array} \right\}$ <p>where</p> <p>Y Any page segments referred to by an overlay will be revised during document processing if the REVOVLY extended JCL keyword is included in the JCL used to submit the job.</p> <p>N The page segments referred to by an overlay will not be revised as a part of REVOVLY processing. However, one or more page segments can still be revised separately using the REVPSEG extended JCL keyword.</p> |

**NOTE:** Specifying REVOPSEG=N is not applicable when the AUTOREV initialization or printer profile parameter is set to either AFP or BOTH. REVOPSEG will default to Y.

---

|                            |                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>             | The REVOPSEG initialization parameter value.                                                                               |
| <b>Example</b>             | REVOPSEG=N                                                                                                                 |
| <b>Overrides</b>           | This parameter overrides the REVOPSEG initialization parameter; it can be overridden by the REVOPSEG extended JCL keyword. |
| <b>Related information</b> | See also the REVOVLY and REVPSEG extended JCL keywords and the AUTOREV initialization and printer profile parameters.      |

## SDLCRLC

---

|                    |                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Indicates whether to compress data streams on a printer-by-printer basis for centralized printers attached via a standard BARR/SNA RJE platform or an SNA interface. XPAF uses an SDLC run-length compression algorithm to compress the data. |
| <b>Scope</b>       | Affects processing of all types of data streams sent to centralized printers attached via a standard BARR/SNA RJE platform or an SNA interface.                                                                                               |
| <b>Syntax</b>      | $\text{SDLCRLC} = \begin{Bmatrix} Y \\ N \end{Bmatrix}$ <p>where</p> <p>Y    Compresses data streams.<br/> N    Does not compress data streams.</p>                                                                                           |
| <b>Default</b>     | Y                                                                                                                                                                                                                                             |
| <b>Example</b>     | SDLCRLC=N                                                                                                                                                                                                                                     |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                         |

## SELECT

---

|                    |                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the BARR/SNA RJE printer that is associated with this printer profile.                                                                                         |
| <b>Scope</b>       | Affects processing of all types of data streams sent to BARR/SNA RJE connected printers.                                                                                  |
| <b>Syntax</b>      | $\text{SELECT} = \text{printer-name}$ <p>where</p> <p><i>printer-name</i>    PRINT1 through PRINT6.</p>                                                                   |
| <b>Default</b>     | PRINT1                                                                                                                                                                    |
| <b>Examples</b>    | <p>SELECT=PRINT1<br/> This example specifies PRINT1 for logical RJE printer PR1.</p> <p>SELECT=PRINT2<br/> This example specifies PRINT2 for logical RJE printer PR2.</p> |
| <b>Overrides</b>   | None.                                                                                                                                                                     |

## SERIAL

---

|                    |                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the printer serial number. XPAF does not use this value, but it is available to user exits in @XXQPPT.                                                                                                                                                                               |
| <b>Scope</b>       | Affects processing of all types of data streams sent to all types of printers.                                                                                                                                                                                                                  |
| <b>Syntax</b>      | $\text{SERIAL} = \left\{ \begin{array}{l} \text{string} \\ \text{blank} \end{array} \right\}$ <p>where</p> <p><i>string</i> Any valid 1- to 16-character alphanumeric serial number. This serial number cannot contain spaces or commas.</p> <p><i>blank</i> No serial number is specified.</p> |
| <b>Default</b>     | blank                                                                                                                                                                                                                                                                                           |
| <b>Example</b>     | SERIAL=3Y6003932                                                                                                                                                                                                                                                                                |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                           |

| Description | Indicates whether JES issues the SETUP message each time the FORMS name changes. For centralized printers that are remotely-attached using standard BARR/SNA RJE, it enables generation of the PDIR. For centralized printers that are remotely-attached using BARR/PRINT for TCP/IP, it enables the BARR OUTPUT statement. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |
| Scope       | Affects processing of all types of data streams sent to all types of printers.                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |

When you start the printer, you must issue a start printer command before the first job will print.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |
|             | N                                                                                                                                                                                                                                                                                                                           | No. When you start the printer, available jobs automatically start printing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |
|             | PDIR                                                                                                                                                                                                                                                                                                                        | <p>Indicates that XPAF will build the PDIR and send it to the BARR/SNA RJE workstation. The PDIR contains this information: date, time, forms, FCB name, copies, volume, I/O (number of print lines), and DSN (job name). You can use the information in these fields to manage your output and control job routing.</p> <p>The copies field passed in the PDIR contains the value specified for the COPIES IBM JCL keyword. BARR/SNA RJE uses this value to determine the number of copies needed. For example, if a value of three is passed in the PDIR, XPAF will transmit the job to the BARR/SNA RJE workstation once, then the BARR/SNA RJE workstation will send the job to the printer three times.</p> <p>If you specify SETUP=(PDIR,NOCOPY), then the copies value is not included in the PDIR. Multiple copies are transmitted from XPAF to the BARR/SNA RJE workstation, and the BARR/SNA RJE workstation sends each copy to the printer one time. For example, if a value of five is specified for the COPIES IBM JCL keyword but the printer profile specifies SETUP=(PDIR,NOCOPY), XPAF will transmit the job to the BARR/SNA RJE workstation five times, and the BARR/SNA RJE workstation will send each copy to the printer once.</p> |  |

*SECUREMAIL*

|                    |                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Indicates whether all e-mails sent to the SMTP server via this printer will be secured with encryption via AT-TLS.                                                                                                            |
| <b>Scope</b>       | Affects processing of all types of data streams that use the e-mailing feature.                                                                                                                                               |
| <b>Syntax</b>      | <p>SECUREMAIL= YES<br/>NO</p> <p>where</p> <p>YES XOSF will use a secure connection when sending an e-mail to the SMTP server.</p> <p>NO XOSF will not use a secure connection when sending an e-mail to the SMTP server.</p> |
| <b>Default</b>     | The value set by the SECUREMAIL initialization parameter.                                                                                                                                                                     |
| <b>Example</b>     | SECUREMAIL=YES                                                                                                                                                                                                                |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                         |

# SFONTLIB

---

**Description** Names the DD statement that specifies the secondary font library for the printer. Use this library to store centralized fonts only.

Although XPAF does not perform dynamic font conversion for DJDE data streams, it looks at the corresponding centralized font to obtain the font metric information it needs to determine line spacing.

**CAUTION:** Do not specify the same DD name here that you specify for the FONTLIB printer profile parameter. You must use separate centralized and decentralized font libraries.

---

**Scope** Affects processing of DJDE data streams sent to decentralized and PCL-capable printers and PDF conversion.

**Syntax** SFONTLIB=*ddname*

where

*ddname* The 1- to 8-character DD name. The DD name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character.

**Default** The CFONTLIB initialization parameter value.

**Example** SFONTLIB=CTESTFNT

**Overrides** None.

**Related information** See also the FONTLIB printer profile parameter.

# SFORMLIB

---

**Description** Names the DD statement that specifies the secondary form library for the printer. Use this library to store centralized forms only.

**Dynamic conversion**

During processing, if a decentralized form is not found in the primary form library specified by the FORMLIB printer profile parameter, XPAF looks for a corresponding centralized form in the secondary form library. If it finds one, XPAF dynamically converts the form to decentralized format, stores it in the primary form library, and sends it to the decentralized printer. The converted form will also be stored on the printer if it has storage capability.

**CAUTION:** Do not specify the same DD name here that you specify for the FORMLIB printer profile parameter. You must use separate centralized and decentralized form libraries.

---

**Scope** Affects processing of DJDE data streams sent to decentralized and PCL-capable printers and PDF conversion.

**Syntax** SFORMLIB=*ddname*  
where  
*ddname* The 1- to 8-character DD name. The DD name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character.

**Default** The CFORMLIB initialization parameter value.

**Example** SFORMLIB=CTESTFRM

**Overrides** None.

**Related information** See also the FORMLIB printer profile parameter.

|                    |                                                                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies whether this printer is available for participation in device sharing via VTAM.                                                                                                                                              |
| <b>Scope</b>       | Affects processing of all types of data streams sent to decentralized and PCL-capable printers that are remotely attached to the host.                                                                                                 |
| <b>Syntax</b>      | $\text{SHARE} = \begin{Bmatrix} Y \\ N \end{Bmatrix}$ <p>where</p> <p>Y The printer is available for participation in device sharing via VTAM.</p> <p>N The printer is not available for participation in device sharing via VTAM.</p> |
| <b>Default</b>     | N                                                                                                                                                                                                                                      |
| <b>Example</b>     | SHARE=Y                                                                                                                                                                                                                                |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                  |

## SHRACQTIME

---

|                            |                                                                                                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the maximum length of time, in minutes, which XPAF will attempt to acquire a shared device. This parameter is valid only if the SHARE printer profile parameter is Y. |
| <b>Scope</b>               | Affects processing of all types of data streams sent to decentralized or PCL-capable printers that are remotely attached to the host.                                           |
| <b>Syntax</b>              | $\text{SHRACQTIME} = nnnnn$ <p>where</p> <p><i>nnnnn</i> 1 through 32767.</p>                                                                                                   |
| <b>Default</b>             | The SHRACQTIME initialization parameter value.                                                                                                                                  |
| <b>Example</b>             | SHRACQTIME=20                                                                                                                                                                   |
| <b>Overrides</b>           | This parameter overrides the SHRACQTIME initialization parameter.                                                                                                               |
| <b>Related information</b> | See also the SHRMSGINT initialization and printer profile parameters.                                                                                                           |

## SHRMSGINT

---

|                            |                                                                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the interval, in minutes, for displaying an informational message during shared device acquisition processing. This parameter is valid only if the SHARE printer profile parameter is Y. |
| <b>Scope</b>               | Affects processing of all types of data streams sent to decentralized or PCL-capable printers that are remotely attached to the host via VTAM.                                                     |
| <b>Syntax</b>              | SHRMSGINT= <i>nnnnn</i><br><br>where<br><i>nnnnn</i> 1 through 32767.                                                                                                                              |
| <b>Default</b>             | The SHRMSGINT initialization parameter value.                                                                                                                                                      |
| <b>Example</b>             | SHRMSGINT=20                                                                                                                                                                                       |
| <b>Overrides</b>           | This parameter overrides the SHRMSGINT initialization parameter.                                                                                                                                   |
| <b>Related information</b> | See also the SHRACQTIME initialization and printer profile parameters.                                                                                                                             |

# SIMAGELIB

---

**Description** Names the DD statement that specifies the secondary image library for the printer. Use this library to store centralized images only.

**Dynamic conversion**

During processing, if a sixelized image is not found in the primary image library specified by the IMAGELIB printer profile parameter, XPAF looks for a corresponding .IMG in the secondary image library. If it finds one, XPAF dynamically converts the image to a sixelized image, stores it in the primary image library, and sends it to the decentralized printer. The converted image will also be stored on the printer if it has storage capability.

**CAUTION:** Do not specify the same DD name here that you specify for the IMAGELIB printer profile parameter. You must use separate centralized and decentralized image libraries.

---

**Scope** Affects processing of DJDE data streams sent to decentralized and PCL-capable printers and PDF conversion.

**Syntax** SIMAGELIB=*ddname*

where

*ddname* The 1- to 8-character DD name. The DD name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character.

**Default** The CIMAGELIB initialization parameter value.

**Example** SIMAGELIB=CTESTIMG

**Overrides** None.

**Related information** See also the IMAGELIB printer profile parameter.

## SLU

---

|                    |                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the VTAM name of the printer. You should obtain the printer name from the VTAM system administrator.                                                                                                                                 |
| <b>Scope</b>       | Affects processing of all types of data streams sent to centralized and decentralized printers that are remotely-attached using a standard BARR/SNA RJE platform.                                                                               |
| <b>Syntax</b>      | SLU= <i>vtam-name</i><br><br>where<br><i>vtam-name</i> The 1- to 8-character VTAM name of the printer, the VTAM name of an RJE session defined by Barr/RJE host definitions (not a 3270 LU name). The name can include alphanumeric characters. |
| <b>Default</b>     | None.                                                                                                                                                                                                                                           |
| <b>Example</b>     | SLU=SLU2222                                                                                                                                                                                                                                     |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                           |

## STARTJDEL

---

|                    |                                                                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies whether XOSF should use the default JDE and JDL values defined in the printer profile or the JDE and JDL values specified via extended JCL or the XJCFSIM table as the starting JDE and JDL for the document.                                                                                  |
| <b>Scope</b>       | Affects processing of LCDS data streams sent to any type of printer.                                                                                                                                                                                                                                     |
| <b>Syntax</b>      | STARTJDEL={ <b>PPT</b>   XJCL}<br><br>where<br>PPT or P LCDS documents will start with the default JDE and JDL values specified in the printer profile table.<br>XJCL or X LCDS documents will start with the default JDE and JDL values specified in extended JCL or via the XJCLSIM table, if present. |
| <b>Default</b>     | STARTJDEL=PPT                                                                                                                                                                                                                                                                                            |
| <b>Example</b>     | STARTJDEL=XJCL                                                                                                                                                                                                                                                                                           |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                    |

## TCPABORT

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | This parameter provides the option of permitting or stopping the submission of the Batch JCL, or whether or not the document should be attached in an e-mail of a print job that is aborted by XPAF.                                                                                                                                                                                                |
| <b>Scope</b>       | Affects processing of all types of data streams sent via the TCP/IP Batch JCL feature (TCPMODE= BATCH or LPR) or as an e-mail attachment.                                                                                                                                                                                                                                                           |
| <b>Syntax</b>      | <p>TCPABORT= { TRANSMIT<br/>NOTRANSMIT }</p> <p>where</p> <p>TRANSMIT      Permits the submission of the batch job to process the resulting document that includes errors, or allows the document to be attached to the e-mail.</p> <p>NOTRANSMIT   Stops the submission of the batch job to process the resulting document that includes errors or does not attach the document to the e-mail.</p> |
| <b>Default</b>     | TRANSMIT                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Example</b>     | TCPABORT= TRANSMIT                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Overrides</b>   | This parameter overrides the TCPABORT initialization parameter.                                                                                                                                                                                                                                                                                                                                     |

## TCPBIND

---

|                    |                                                                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the local TCP/IP port numbers on which to bind when transmitting print jobs.                                                                                                                          |
| <b>Scope</b>       | Used to specify the local port numbers for print servers that require a specific port number range.                                                                                                             |
| <b>Syntax</b>      | <p>TCPBIND=xxxx,yyyy</p> <p>where</p> <p>xxxx           Indicates the local port number used as a starting point from which to bind print jobs.</p> <p>yyyy           Indicates the number of ports to use.</p> |
| <b>Default</b>     | None.                                                                                                                                                                                                           |
| <b>Example</b>     | TCPBIND=(721,11)                                                                                                                                                                                                |
| <b>Overrides</b>   | None.                                                                                                                                                                                                           |

## TCPBUFSIZE

---

|                            |                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the size of the buffer area allocated for passing data to the TCP/IP address space.              |
| <b>Scope</b>               | Affects processing of all types of data streams sent to any printer using the TCP/LPR or TCP/IP protocols. |
| <b>Syntax</b>              | TCPBUFSIZE = nnnnn<br>where<br>nnnnn Number of bytes                                                       |
| <b>Default</b>             | 32767                                                                                                      |
| <b>Example</b>             | TCPBUFSIZE=9000                                                                                            |
| <b>Overrides</b>           | None.                                                                                                      |
| <b>Related information</b> | See also the TCPBUFSIZE initialization parameter.                                                          |

## TCPCONNECT

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies how XPAF will acquire the IP address for processing documents from a JES queue.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Scope</b>       | Affects processing of all types of data streams sent to any device using the direct LPR protocols.                                                                                                                                                                                                                                                                                                                                                      |
| <b>Syntax</b>      | TCPCONNECT = $\left\{ \begin{array}{l} \text{OPEN} \\ \text{CLOSE} \end{array} \right\}$<br>where<br><div style="display: flex; justify-content: space-between;"> <div>OPEN</div> <div>The IP address is acquired when the document is opened in the JES queue.</div> </div> <div style="display: flex; justify-content: space-between;"> <div>CLOSE</div> <div>The IP address is acquired when the document is closed from the JES queue.</div> </div> |
| <b>Default</b>     | The setting specified by the TCPCONNECT initialization parameter.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Example</b>     | TCPCONNECT= OPEN                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

# TCPMAIL

---

|                    |                                                                                     |                                                                                         |
|--------------------|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies whether a document will be sent to the PDF printer in addition to e-mail. |                                                                                         |
| <b>Scope</b>       | Affects processing of all documents sent as e-mail attachments.                     |                                                                                         |
| <b>Syntax</b>      | TCPMAIL=BOTH   MAILONLY   YES<br>where                                              |                                                                                         |
|                    | BOTH                                                                                | The document be sent to both the user (as an e-mail attachment) and to the PDF printer. |
|                    | MAILONLY                                                                            | The document will only be sent to the user as an e-mail attachment.                     |
|                    | YES                                                                                 | The document will only be sent to the user as an e-mail attachment                      |
| <b>Default</b>     | none. The document will not be sent as an e-mail attachment.                        |                                                                                         |
| <b>Example</b>     | TCPMAIL=BOTH                                                                        |                                                                                         |
| <b>Overrides</b>   | None                                                                                |                                                                                         |

## TCPMODE

| <b>Description</b>         | Specifies the TCP protocol used to send data to this printer XPAF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |                                                                                                                                                                                                                                                                                                                                                                      |         |                                                                                                                   |        |                                                                                                                                                    |        |                                                                                                       |       |                                                                                                                                                               |
| <b>Scope</b>               | Affects processing of all types of data streams sent to all types of printers using the TCP/LPR or TCP/IP protocols.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |                                                                                                                                                                                                                                                                                                                                                                      |         |                                                                                                                   |        |                                                                                                                                                    |        |                                                                                                       |       |                                                                                                                                                               |
| <b>Syntax</b>              | <p>TCPMODE= { BATCH   DATASET   RENAME   TCPIP   TCPLPR }</p> <p>where</p> <table> <tr> <td>BATCH</td><td>Indicates that the TCP/LPR protocol is used to send data to this printer. It also indicates that the resulting print file is processed via a batch job that is built from the skeleton JCL specified by the LPRJCL parameter and submitted via the internal reader. A sample JCL (XTCPIPJ) is provided to illustrate a method of sending a print file via batch LPR.</td></tr> <tr> <td>DATASET</td><td>Indicates that the data created by XPAF is saved in a dataset. No further processing of the dataset is performed.</td></tr> <tr> <td>RENAME</td><td>Specifies that the data created by XPAF is saved in a dataset that is then renamed to a name specified in the XODB Mail File Name field, XODBMFNM.</td></tr> <tr> <td>TCPLPR</td><td>Indicates that the direct TCP/LPR protocol is used to send data directly from XPAF to the LPD Server.</td></tr> <tr> <td>TCPIP</td><td>Indicates that the TCP/IP direct socket protocol is used to send data to this printer. This requires the TCPPORT value to be set to the server's port number.</td></tr> </table> | BATCH | Indicates that the TCP/LPR protocol is used to send data to this printer. It also indicates that the resulting print file is processed via a batch job that is built from the skeleton JCL specified by the LPRJCL parameter and submitted via the internal reader. A sample JCL (XTCPIPJ) is provided to illustrate a method of sending a print file via batch LPR. | DATASET | Indicates that the data created by XPAF is saved in a dataset. No further processing of the dataset is performed. | RENAME | Specifies that the data created by XPAF is saved in a dataset that is then renamed to a name specified in the XODB Mail File Name field, XODBMFNM. | TCPLPR | Indicates that the direct TCP/LPR protocol is used to send data directly from XPAF to the LPD Server. | TCPIP | Indicates that the TCP/IP direct socket protocol is used to send data to this printer. This requires the TCPPORT value to be set to the server's port number. |
| BATCH                      | Indicates that the TCP/LPR protocol is used to send data to this printer. It also indicates that the resulting print file is processed via a batch job that is built from the skeleton JCL specified by the LPRJCL parameter and submitted via the internal reader. A sample JCL (XTCPIPJ) is provided to illustrate a method of sending a print file via batch LPR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |                                                                                                                                                                                                                                                                                                                                                                      |         |                                                                                                                   |        |                                                                                                                                                    |        |                                                                                                       |       |                                                                                                                                                               |
| DATASET                    | Indicates that the data created by XPAF is saved in a dataset. No further processing of the dataset is performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |                                                                                                                                                                                                                                                                                                                                                                      |         |                                                                                                                   |        |                                                                                                                                                    |        |                                                                                                       |       |                                                                                                                                                               |
| RENAME                     | Specifies that the data created by XPAF is saved in a dataset that is then renamed to a name specified in the XODB Mail File Name field, XODBMFNM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |                                                                                                                                                                                                                                                                                                                                                                      |         |                                                                                                                   |        |                                                                                                                                                    |        |                                                                                                       |       |                                                                                                                                                               |
| TCPLPR                     | Indicates that the direct TCP/LPR protocol is used to send data directly from XPAF to the LPD Server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |                                                                                                                                                                                                                                                                                                                                                                      |         |                                                                                                                   |        |                                                                                                                                                    |        |                                                                                                       |       |                                                                                                                                                               |
| TCPIP                      | Indicates that the TCP/IP direct socket protocol is used to send data to this printer. This requires the TCPPORT value to be set to the server's port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |                                                                                                                                                                                                                                                                                                                                                                      |         |                                                                                                                   |        |                                                                                                                                                    |        |                                                                                                       |       |                                                                                                                                                               |

| <b>Related information</b> | <p>See also the IPADDR, LPRBNDRY, LPRDSN, LPRJCL, LPRQNAME, and TCPPORT printer profile parameters for information on setting up your system for TCP batch printing. For LPR protocol requests, see also the OPDALLOC, OPDUNIT, OPHLQ, and OPVOLSER initialization parameters for information on specifying the characteristics of the interim dataset used during TCP batch printing.</p> <p>If you specify TCPMODE=RENAME, you can set the XODBMFNM field via the MAILFILE= IBM JCL Keyword, the XFILENAME enhanced DJDE, via a trigger file when splitting an LCDS document, or via XOSF User Exit 02. The name can be a valid sequential file name, partitioned dataset or library (PDSE) name, which must include the member name, eg. MAILFILE=TC.DAILY.REPORT(D141031), or a UNIX file name, eg. MAILFILE=/u/xpaf/dailyreport/D141031.PDF</p>                                                                                                                                                                                                                                                                                                                               |       |                                                                                                                                                                                                                                                                                                                                                                      |         |                                                                                                                   |        |                                                                                                                                                    |        |                                                                                                       |       |                                                                                                                                                               |

|                            |                                                                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the TCP/IP port number of this printer. Refer to your printer documentation to determine the correct port number to use.                                |
| <b>Scope</b>               | Used for Direct IP or Direct LPR printing only. Affects processing of all types of data streams sent to any printer attached via TCP/IP.                          |
| <b>Syntax</b>              | TCPPORT= <i>nnnnn</i><br><br>where<br><i>nnnnn</i> 0 through 65535.                                                                                               |
| <b>Default</b>             | 515                                                                                                                                                               |
| <b>Example</b>             | TCPPORT=9100                                                                                                                                                      |
| <b>Overrides</b>           | None.                                                                                                                                                             |
| <b>Related information</b> | See also the IPADDR, LPRBNDRY, LPRDSN, LPRJCL, LPRQNAME, and TCPMODE printer profile parameters for information on setting up your system for TCP batch printing. |

## TCPWAIT

---

|                    |                                                                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the time, in one hundredths of a second, that XOSF will wait after sending a buffer of data to the TCPIP destination. This parameter is provided to avoid XOSF flooding the network or tying up the CPU on very fast systems. |
| <b>Scope</b>       | Used for Direct IP or Direct LPR printing only. Affects processing of all types of data streams sent to any printer attached via TCP/IP.                                                                                                |
| <b>Syntax</b>      | TCPWAIT= <i>nnn</i><br><br>where<br><i>nnnnn</i> 0 through 200.                                                                                                                                                                         |
| <b>Default</b>     | 0                                                                                                                                                                                                                                       |
| <b>Example</b>     | TCPWAIT=50                      * Wait 50/100 = 1/2 a second                                                                                                                                                                            |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                   |

## TDF

---

|                    |                                                                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Indicates whether the tracking DJDE function is activated. If you specify TDF=Y, all DJDEs encountered in the data stream are sent to the SYSLOG and XLOG. |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all printers.                                                                                              |

|                            |                                                                                                                  |
|----------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | TDF=Y   N<br>where<br>Y Activates the tracking DJDE function.<br>N Does not activate the tracking DJDE function. |
| <b>Default</b>             | The TDF initialization parameter value.                                                                          |
| <b>Example</b>             | TDF=N                                                                                                            |
| <b>Overrides</b>           | This parameter overrides the TDF initialization parameter.                                                       |
| <b>Related information</b> | See also the TDF initialization parameter.                                                                       |

## UCS

---

|                            |                                                                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Indicates whether Universal Character Sets (UCSs) are transmitted to centralized printers.                                                                                                      |
| <b>Scope</b>               | Affects processing of line-mode and DJDE data streams sent to centralized printers.                                                                                                             |
| <b>Syntax</b>              | $\text{UCS} = \left\{ \begin{array}{c} \text{Y} \\ \text{N} \end{array} \right\}$ <p>where</p> <p>Y   UCSs are transmitted to the printer.<br/>N   UCSs are not transmitted to the printer.</p> |
| <b>Default</b>             | The UCS initialization parameter value.                                                                                                                                                         |
| <b>Example</b>             | UCS=N                                                                                                                                                                                           |
| <b>Overrides</b>           | This parameter overrides the UCS initialization parameter; it can be overridden by the UCS IBM JCL keyword.                                                                                     |
| <b>Related information</b> | See also the UCSPREF and SYSFONT initialization parameters and the CHARS IBM JCL keyword.                                                                                                       |

## UNIQNAME

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies whether a unique 6-character suffix is generated for a converted overlay.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Scope</b>               | Affects processing of AFP data streams sent to centralized printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Syntax</b>              | $\text{UNIQNAME} = \left\{ \begin{array}{c} \text{Y} \\ \text{N} \end{array} \right\}$ <p>where</p> <p><b>Y</b> For a converted overlay, generates a form name with a unique 6-character suffix. For example, if the overlay name is O1XEROX1, the converted overlay is stored in the centralized form library with a name such as "XEROX1 -P-11-XG112A". After it converts the overlay to a form and stores it in the centralized form library, XPAF uses that form without reconverting the overlay.</p> <p>If a native form of the same name already exists in the centralized form library, XPAF ignores the existing form, converts the overlay, and generates a unique 6-character suffix.</p> <p>If a preconverted overlay was converted without using the UNIQNAME parameter or if you specified UNIQNAME=N, XPAF uses the existing name found in the centralized form library without reconverting the overlay.</p> <p>If a preconverted overlay already exists in the centralized form library and you specify the REVOVLY extended JCL keyword in the AFP data stream, XPAF reconverts the overlay and stores it using the original name.</p> <p><b>N</b> For a converted overlay, uses the original overlay name without the O1 prefix as the 6-character suffix. For example, if the overlay name is O1XEROX1, the converted overlay name stored in the centralized form library will be "XEROX1 -P-11-XEROX1".</p> <p>If a native form of the same name already exists in the centralized form library, XPAF uses the existing form and does not convert the overlay.</p> <p>If you specify the REVOVLY extended JCL keyword in the AFP data stream, XPAF reconverts the overlay and stores it using the original name.</p> |
| <b>Default</b>             | The UNIQNAME initialization parameter value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Example</b>             | UNIQNAME=Y                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Overrides</b>           | This parameter overrides the UNIQNAME initialization parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Provides the cuu device address of a locally-attached printer. A unique address must be given for each local printer including WRITER=TAPE or WRITER=DISK printers. This address is used to create unique table names for printer resource management. For FILE or DISK only printers, the cuu does not actually have to exist. |
| <b>Scope</b>               | Affects processing of all types of data streams sent to centralized printers.                                                                                                                                                                                                                                                   |
| <b>Syntax</b>              | UNIT= <i>nnnn</i><br><br>where<br><br><i>nnnn</i> 0000 through FFFF. Any valid four-digit hexadecimal device address. A slash ( / ) is not required preceding the four-digit device address. Also, you may omit a leading zero from the address. XPAF will add a zero in front of a three-digit entry.                          |
| <b>Default</b>             | None.                                                                                                                                                                                                                                                                                                                           |
| <b>Examples</b>            | UNIT=E23<br><br>In this example, XPAF adds a leading zero so that 0E23 is used as the device address.<br><br>UNIT=5384<br><br>In this example, 5384 is a valid four-digit device address.                                                                                                                                       |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                           |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Identifies the varying paper size table used by XPAF to determine the physical paper size which corresponds to the AFP bin number for the current printer. XPAF evaluates the currently active paper name table to determine the dimensions of the paper name specified in this table.<br><br>This table resides in the library specified in the XOSF start-up proc DD statement named by the PAPTBLDD initialization or printer profile parameter. |
| <b>Scope</b>               | Affects processing of AFP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Syntax</b>              | VARPAPTB= <i>table-name</i><br><br>where<br><br><i>table-name</i> The 1- to 16-character table name. The name can include alphanumeric or national (\$, #, @) characters.                                                                                                                                                                                                                                                                           |
| <b>Default</b>             | None.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Example</b>             | VARPAPTB=PRTR01A                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Overrides</b>           | This parameter overrides the VARPAPTB initialization parameter; it can be overridden by the VARPAPTB extended JCL keyword.                                                                                                                                                                                                                                                                                                                          |
| <b>Related information</b> | Refer to <a href="#">Section Three: Managing Resources with XPAF</a> for more information on paper-related table processing.                                                                                                                                                                                                                                                                                                                        |

---

**NOTE:** XPAF cannot verify that the paper size specified matches the paper actually loaded on the printer.

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the type of value XPAF will use to determine the valid printable area when checking for data-off-page conditions.                                                                                                                                                                                                                                                                                           |
| <b>Scope</b>               | Affects processing of page-formatted and AFP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                              |
| <b>Syntax</b>              | $\text{VPA} = \left\{ \begin{array}{c} \text{L} \\ \text{P} \end{array} \right\}$ <p>where</p> <p>L Logical. XPAF compares the logical and physical page values and uses the lesser value to determine the valid printable area when checking for data-off-page conditions.</p> <p>P Physical. XPAF uses only the physical page to determine the valid printable area when checking for data-off-page conditions.</p> |
| <b>Default</b>             | The VPA initialization parameter value.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Example</b>             | VPA=L                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Overrides</b>           | This parameter overrides the VPA initialization parameter.                                                                                                                                                                                                                                                                                                                                                            |
| <b>Related information</b> | See also the VPA initialization parameter and the DATAACK IBM JCL keyword.                                                                                                                                                                                                                                                                                                                                            |

## WRITER

---

|                    |                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the type of writer that is used to communicate with a printer or print server.                                            |
| <b>Scope</b>       | Affects processing of all types of data streams sent to all types of printers.                                                      |
| <b>Syntax</b>      | $\text{WRITER} = \left\{ \begin{array}{l} \text{LOCAL[,TAPEN,DISK,ONLINE]} \\ \text{REMOTE[,TAPEN,DISK,ONLY]} \end{array} \right\}$ |

where

**LOCAL** Sends to a channel-attached centralized (local) printer.

**REMOTE** Sends to remotely-attached Xerox printers via TCP/IP or VTAM.

Only one of these values LOCAL or REMOTE can be specified for a device.

The following values can be specified alone or with LOCAL:

**TAPEn** Directs output to file in addition to or in place of a local printer, where n specifies the file density according to z/OS JCL density parameters of 2, 3, or 4. If you do not enter a density parameter, the file is written at the z/OS default density. For more information, refer to the DEN subparameter in the appropriate z/OS JCL reference manual. XPAF generates an output dataset name in the format *prefix.printerid*.

**DISK** Directs output to disk (in file format) in addition to or in place of a local printer. XPAF generates an output dataset name in the format *prefix.printerid.date.time*.

**ONLINE** XPAF processes the local print job and sends the output to file and/or disk as specified in the WRITER printer profile parameter and/or the OPWRITER extended JCL keyword.

ONLINE specifies online format, which is the format used to send data over the channel to a local printer. If you omit this parameter, XPAF writes the output in offline format.

You can print a file or disk dataset that was written in online format using IEBGENER and specifying either an XPAF- or JES-controlled printer. Documents written in offline format can be printed from file only and with the printer offline. For further information about printing documents from file and/or disk, refer to [Section Four: Printing Documents with XPAF](#).

The following values can be specified with REMOTE:

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TAPE<math>n</math></b> | Directs output to file in addition to or in place of a local printer, where $n$ specifies the file density according to z/OS density parameters of 2, 3, or 4. If you do not enter a density parameter, the file is written at the z/OS default density. For more information, refer to the DEN subparameter in the appropriate z/OS JCL reference manual. XPAF generates an output dataset name in the format <i>prefix.printerid</i> . |
| <b>DISK</b>               | Directs output to disk (in file format) in addition to or in place of a local printer. XPAF generates an output dataset name in the format <i>prefix.printerid.date.time</i> .                                                                                                                                                                                                                                                           |
| <b>ONLY</b>               | Writes the dataset to the TAPE and/or DISK dataset, but not to the printer defined by the printer profile.                                                                                                                                                                                                                                                                                                                               |

If you select output to file and/or disk, first review these initialization parameters described in chapter 40, "[Initialization parameters](#)."

- OPDALLOC and OPDALLOS
- OPDUNIT
- OPHLQ
- OPTEXPTD
- OPTUNIT
- OPVOLSER

**Default** Centralized printers: LOCAL (no printer device is opened)  
PCL-capable printers and PDF conversion: REMOTE

**Examples** WRITER=LOCAL

Sends print data to the local printer defined by the UNIT printer profile parameter.

WRITER=REMOTE

Sends print data to the remote printer defined by the SLU or TCP/IP configuration printer profile parameters.

WRITER=

Assumes LOCAL printer type. If OPWRITER is specified in the JCL, sends all print data to the destination as specified for OPWRITER. If OPWRITER is not specified in the JCL, no data is processed, and an error message is generated.

WRITER=ONLINE

Same as WRITER=, except the data is in online format.

WRITER=TAPE

Sends local job print data to file in offline format, to be read directly by a local printer's file drive and printed.

WRITER=DISK

Sends local job print data to disk in offline format. This data must be transferred to file for it to be read directly by a local printer's file drive and printed.

WRITER=(DISK,ONLINE)

Sends print data to disk in online format. This data can be printed directly from disk using IEBGENER.

WRITER=(LOCAL,ONLINE)

Sends print data to the local printer defined by the UNIT printer profile parameter. If the job's JCL specifies file and/or disk for OPWRITER, the output also is created in online format and sent to file and/or disk as specified.

WRITER=(REMOTE,DISK)

Sends print data to the remote printer defined by the SLU printer profile parameter and to disk.

WRITER=(REMOTE,TAPE,ONLY)

Sends local job print data only to file, not to the printer.

WRITER=(DISK,TAPE,ONLINE)

Sends print data to disk and file in online format. No actual printer is used.

**Overrides**

None.

**Related information**

All values specified for the OPWRITER extended JCL keyword are used in addition to the WRITER values. See also the OPDALLOC, OPDUNIT, OPHLQ, OPTEXPTD, OPTUNIT, OPTVOLCT, and OPVOLSER initialization parameters and the UNIT printer profile parameter.

## XEMAILXN

---

- Description** For e-mail notification, specifies the file extension to be appended to the file name of the document attached to the e-mail.
- Scope** Affects processing of all documents sent as e-mail attachments.
- Syntax** XEMAILXN=value  
where  
*value* Identifies the file extension for the document.
- Default** *value* is based on the Printer Command Language for the printer specified in the DEVICE printer profile parameter.

| Printer Type  | File Extension |
|---------------|----------------|
| Centralized   | META           |
| Decentralized | XES            |
| PCL-capable   | PCL5           |
| PDF Transform | PDF            |

For example, if you submit a job called "SAMPLE" to a printer whose profile specifies DEVICE=PCL and TCPMAIL=MAILONLY, then XPAF will generate the document as an e-mail attachment called "SAMPLE.PCL5".

- Example** XEMAILXN=PDF
- Overrides** None

## XJCFMODE

---

|                    |                                                                                      |
|--------------------|--------------------------------------------------------------------------------------|
| <b>Description</b> | Indicates the type of XJCF processing support used for this printer.                 |
| <b>Scope</b>       | Affects processing of line-mode and DJDE data streams sent to all types of printers. |
| <b>Syntax</b>      | XJCFMODE=[ C   F   S   <b>N</b> ]                                                    |

where

- N XJCF support is not required.
- S XPAF simulates XJCF processing via the XJCFSIM simulation table. XJCF is not installed.
- F XPAF simulates XJCF processing only for the first dataset in the output group.
- C XPAF coexists with XJCF through the XIM table. XJCF is installed.

**Default** N

**Example** XJCFMODE=S

**Overrides** You can override this parameter using the XJCFSIM extended JCL keyword.

**Related information** The procedures for installing and using XPAF with XJCF are described in both [Section Two: Installing and Customizing XPAF](#) and [Section Four: Printing Documents with XPAF](#). These sections address both coexistence and simulation modes.

## XJCFTABL

---

|                            |                                                                                                                                                                                                                                                                                                                             |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies which XJCFSIM table should be used for this printer.                                                                                                                                                                                                                                                              |
| <b>Scope</b>               | Affects processing of all types of data streams sent to all types of printers.                                                                                                                                                                                                                                              |
| <b>Syntax</b>              | XJCFTABL=xxxxxxx<br>where<br>xxxxxxx is the 1- to 8-character name of the XJCFSIM table load module to be used. The name can include alphanumeric or national (\$, #, @) characters and cannot begin with a number. It is the users responsibility to assemble and link-edit all XJCFSIM tables into their XPFLOAD library. |
| <b>Default</b>             | XJCFSIM                                                                                                                                                                                                                                                                                                                     |
| <b>Example</b>             | XJCFTABL=MYXJCF                                                                                                                                                                                                                                                                                                             |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                       |
| <b>Related information</b> | See also the XJCFMODE printer profile parameter and the XJCFSIM Extended JCL keyword.                                                                                                                                                                                                                                       |
| <b>Note</b>                | It is the user's responsibility to assemble and link-edit XJCFSIM tables under different names into their XPFLOAD library before they can be referenced with this keyword.                                                                                                                                                  |

## XJOBTMEM

---

|                            |                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies Xerox job ticket information to be retrieved from the dataset defined by LPRDSN.                                                                                                                                                                                                  |
| <b>Scope</b>               | Affects processing of all types of data streams sent to NPS and DocuSP printers.                                                                                                                                                                                                            |
| <b>Syntax</b>              | XJOBTMEM=nnnnnnnn<br>where<br>nnnnnnnn The 1- to 8-character name for the desired job ticket member name. The name can include alphanumeric or national (\$, #, @) characters.                                                                                                              |
| <b>Example</b>             | XJOBTMEM=XJOBTICK                                                                                                                                                                                                                                                                           |
| <b>Related Information</b> | LPRDSN specifies the name of the PDS in which the member resides. For more information on job tickets see the XJOBTMEM extended JCL keyword, and refer to chapter 13, " <a href="#">Setting up PCL-capable printers</a> " in <a href="#">Section Two: Installing and Customizing XPAF</a> . |

## XMAILADR

---

|                    |                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the name of the member that contains the users who will be e-mailed via this printer. This member must reside in the PDS dataset pointed to by the LPRDSN printer profile parameter.                               |
| <b>Scope</b>       | Affects processing of all documents sent as e-mail attachments.                                                                                                                                                              |
| <b>Syntax</b>      | XMAILADR=member-name<br>where<br><i>member-name</i> The 1- to 8-character member name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character. |
| <b>Default</b>     | None                                                                                                                                                                                                                         |
| <b>Example</b>     | XMAILADR=EMAILADR                                                                                                                                                                                                            |
| <b>Overrides</b>   | None                                                                                                                                                                                                                         |

## XPDFFSUB

---

|                    |                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the name of the member that contains PDF font substitution table. This member must reside in the XINPARM PDS dataset.                                                                                              |
| <b>Scope</b>       | Affects processing of all PDF documents.                                                                                                                                                                                     |
| <b>Syntax</b>      | XPDFFSUB=member-name<br>where<br><i>member-name</i> The 1- to 8-character member name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character. |
| <b>Default</b>     | The value specified by the XPDFFSUB initialization parameter.                                                                                                                                                                |
| <b>Example</b>     | XPDFFSUB=FONTSUB2                                                                                                                                                                                                            |
| <b>Overrides</b>   | You can override this parameter by specifying the XPDFFSUB extended JCL keyword.                                                                                                                                             |

## XPJLMEM

---

|                            |                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies a PJJ member to be retrieved from the dataset defined by LPRDSN.                                                                                                                                                                                                                    |
| <b>Scope</b>               | Affects processing of all types of data streams sent to PCL-capable printers.                                                                                                                                                                                                                 |
| <b>Syntax</b>              | <p>XPJLMEM=nnnnnnnn</p> <p>where</p> <p>nnnnnnnn The 1- to 8-character name for the desired PJJ member name. The name can include alphanumeric or national (\$, #, @) characters.</p>                                                                                                         |
| <b>Example</b>             | XPJLMEM=XPJL3COP                                                                                                                                                                                                                                                                              |
| <b>Related Information</b> | <p>LPRDSN specifies the name of the PDS in which the member resides.</p> <p>For more information on PJJ see the XPJLMEM extended JCL keyword, and refer to chapter 13, “<a href="#">Setting up PCL-capable printers</a>” in <a href="#">Section Two: Installing and Customizing XPAF</a>.</p> |

## XSHADE

---

|                    |                                                                                                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies whether to enhance cells within AFP images that are recognized as a shading pattern.                                                                                                                                               |
| <b>Scope</b>       | Affects processing of AFP data streams sent to all types of printers.                                                                                                                                                                        |
| <b>Syntax</b>      | $\text{XSHADE} = \left\{ \begin{array}{l} \text{YES} \\ \text{NO} \end{array} \right\}$ <p>where</p> <p>YES      Shading cells will be enhanced.</p> <p>NO        Shading cells will not be enhanced; standard image processing is used.</p> |
| <b>Default</b>     | The XSHADE initialization parameter value.                                                                                                                                                                                                   |
| <b>Example</b>     | XSHADE=NO                                                                                                                                                                                                                                    |
| <b>Overrides</b>   | This parameter overrides the XSHADE initialization parameter; it can be overridden by the XSHADE extended JCL keyword.                                                                                                                       |

## XSMTPCTL

---

|                    |                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the default HTML source member name to be used when creating e-mail attachments. This member must reside in the PDS dataset pointed to by the LPRDSN printer profile parameter. A sample HTML source member, XSMTPCTL, is provided in XPFSAMP. |
| <b>Scope</b>       | Affects processing of all documents sent as HTML-format e-mail attachments.                                                                                                                                                                              |
| <b>Syntax</b>      | <p>XSMTPCTL=member-name</p> <p>where</p> <p><i>member-name</i>    The 1- to 8-character member name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character.</p>           |
| <b>Default</b>     | None                                                                                                                                                                                                                                                     |
| <b>Example</b>     | XSMTPCTL=HTMLDECK                                                                                                                                                                                                                                        |
| <b>Overrides</b>   | None                                                                                                                                                                                                                                                     |

## XTCPJNAM

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the format of the job name used in the LPR Job name (LPR control file 'J' parameter), the LPR Document name (LPR control file 'N' parameter), the EPS Socket header document name, and/or the e-mail subject text.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Scope</b>               | Affects processing of all types of data streams sent to any printer via LPR or to a DocuSP EPS printer via the socket gateway.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Syntax</b>              | XTCPJNAM= [xxxxxxx   JESINFO]<br>where<br>xxxxxxx is the name of the member to be found in the library specified by the LPRDSN= parameter or JESINFO indicates that the standard format as described below is to be used                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## XVIPPMEM

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the VIPP member to be retrieved from the dataset defined by LPRDSN.                                                                                                                                                                                                                                                                                                           |
| <b>Scope</b>               | Affects processing of line-mode data streams sent to VIPP-enabled printers.                                                                                                                                                                                                                                                                                                             |
| <b>Syntax</b>              | XVIPPMEM=nnnnnnnnnn<br><br>where<br><br>nnnnnnnnnn The 1- to 8-character name for the desired VIPP member name. The name can include alphanumeric or national (\$, #, @) characters.                                                                                                                                                                                                    |
| <b>Example</b>             | XVIPPMEM=XPAFJDT                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Related Information</b> | LPRDSN specifies the name of the PDS in which the member resides.<br>For more information on VIPP see the PRMODE JCL keyword, and refer to chapter 13, “ <a href="#">Setting up PCL-capable printers</a> ” in <i>Section Two: Installing and Customizing XPAF</i> , and chapter 37, “ <a href="#">Printing VIPP documents</a> ,” in <i>Section Four: Printing Documents with XPAF</i> . |

## 42. *Standard IBM JCL keywords*

IBM JCL keywords provide XPAF with job-specific values. The IBM JCL keywords that XPAF accepts are listed on the pages that follow. If XPAF does not support an IBM JCL keyword, you do not need to remove it from the statement; XPAF ignores it.

### *Specifying IBM JCL keywords*

---

Unless otherwise noted, XPAF will recognize and process IBM JCL keywords coded on either the OUTPUT or SYSOUT DD statements.

### *Coding IBM JCL keywords*

---

XPAF follows standard IBM JCL coding conventions. Items such as commas, equal signs, parentheses, and asterisks are required entries and must be coded exactly as they appear in the syntax definitions.

For detailed information on coding JCL, refer to the appropriate IBM JCL reference manual.

### *Standard IBM JCL support*

---

The following IBM JCL keywords are supported by XPAF.

## ADDRESS

---

|                            |                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies a descriptive address to be used on the separator pages of an output dataset. This value also is available in user exit 05 for constructing customized banner pages.                                                                                                                                                              |
| <b>Scope</b>               | For JES2 and JES3 systems running at version 4.2 or higher, affects processing of all types of data streams sent to centralized printers. Also affects processing of all types of data streams sent to decentralized and PCL-capable printers if you have changed the SETC statement in sample user exit XUXIT05B from 'REMOTE' to 'LOCAL'. |
| <b>Syntax</b>              | ADDRESS=('string1'[,...,'string4'])<br><br>where<br><br>'string' The 1- to 60-character address enclosed in single quotation marks. Each address can include alphanumeric or national (\$, #, @) characters.                                                                                                                                |
| <b>Example</b>             | //OUT2 OUTPUT ADDRESS=('LAB A',<br>// '123 Sunshine Parkway',<br>// 'Sandy Beach, FL',<br>// '32111')                                                                                                                                                                                                                                       |
| <b>Overrides</b>           | You can override this keyword by specifying a value in the XODBADRT field in @XODB in user exit 02.                                                                                                                                                                                                                                         |
| <b>Related information</b> | Refer to <a href="#">Section Two: Installing and Customizing XPAF</a> for more information about user exits. Review the comments in the appropriate sample user exit member in XPFSAMP for more information on how to modify the sample.                                                                                                    |

## BUILDING

---

|                            |                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies a building identification to be used on the separator pages of an output dataset. This value is also available in user exit 05 for constructing customized banner pages.                                                                                                                                                          |
| <b>Scope</b>               | For JES2 and JES3 systems running at version 4.2 or higher, affects processing of all types of data streams sent to centralized printers. Also affects processing of all types of data streams sent to decentralized and PCL-capable printers if you have changed the SETC statement in sample user exit XUXIT05B from 'REMOTE' to 'LOCAL'. |
| <b>Syntax</b>              | <p>BUILDING='string'</p> <p>where</p> <p>'string' The 1- to 60-character building identification enclosed in single quotation marks. The building identification can include alphanumeric or national (\$, #, @) characters.</p>                                                                                                            |
| <b>Example</b>             | //OUT2 OUTPUT BUILDING='RED@640'                                                                                                                                                                                                                                                                                                            |
| <b>Overrides</b>           | You can override this keyword by specifying a value in the XODBLDT field in @XODB in user exit 02.                                                                                                                                                                                                                                          |
| <b>Related information</b> | Refer to <a href="#">Section Two: Installing and Customizing XPAF</a> for more information about user exits. ## CHARS

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p>Specifies the fonts used for AFP line data when no font name is specified in the PAGEDEF. If CHARS specifies the same name as the SYSFONT initialization parameter, the CHARS name is ignored. To use the CHARS name for AFP processing, the SYSFONT initialization parameter and the CHARS IBM JCL keyword must specify different names.</p> <p>If you include the UCS IBM JCL keyword in your JCL but not the CHARS IBM JCL keyword, XPAF uses the UCS value as a CHARS value unless you include UCS=Y in the initialization or printer profile parameters.</p> <p>If neither the CHARS nor the UCS IBM JCL keywords are in effect, XPAF uses the SYSFONT initialization parameter value as a CHARS value.</p> |
| <b>Scope</b>               | Affects processing of AFP data streams sent to all types of printers. Also affects processing of XJCF simulation mode data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Syntax</b>              | <p>CHARS=(<i>font-name1</i>[,...,<i>font-name4</i>])</p> <p>where</p> <p><i>font-name</i> The font name.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Example</b>             | //OUT1 OUTPUT DEST=PRNTR1,CHARS=(PR12,PB14)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Related information</b> | <p>See also the UCS and SYSFONT initialization parameters, the UCS printer profile parameter, and the UCS IBM JCL keyword.</p> <p>See also the OPTCD and TRC IBM JCL keywords.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## CKPTPAGE

---

|                    |                                                                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the number of physical pages to be transmitted or printed before the next SYSOUT dataset checkpoint is taken.                              |
| <b>Scope</b>       | Affects processing of all data streams to centralized printers. Affects processing of DJDE, page-formatted, and AFP data streams to remote printers. |
| <b>Syntax</b>      | <p>CKPTPAGE=<i>nnnnn</i></p> <p>where</p> <p><i>nnnnn</i> 1 through 32767.</p>                                                                       |
| <b>Example</b>     | //OUT1 OUTPUT CKPTPAGE=25                                                                                                                            |
| <b>Overrides</b>   | This keyword overrides the CKPTPAGE JES printer definition parameter.                                                                                |

## CLASS

---

|                    |                                                                                                                                                                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the operator-assigned output class for the job.<br><br><b>For DJDE data streams when running in XJCF simulation mode:</b><br>Determines which DJDEs are generated for an XJCF simulation job, based on the entries for the class in the XJCFSIM table. |
| <b>Scope</b>       | Affects processing of all types of data streams sent to all types of printers. When running in XJCF simulation mode, affects processing of DJDE data streams sent to all types of printers.                                                                      |
| <b>Syntax</b>      | CLASS= <i>class</i><br><br>where<br><i>class</i> The single character or digit output class for the job. You can specify A through Z or 0 through 9.                                                                                                             |
| <b>Example</b>     | //OUT1 OUTPUT CLASS=D                                                                                                                                                                                                                                            |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                            |

## CONTROL

---

|                    |                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies either that each logical record starts with a carriage control character or that the output will be printed with single, double, or triple spacing.                                                                                                                      |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                                                                                             |
| <b>Syntax</b>      | CONTROL= {<br>PROGRAM<br>SINGLE<br>DOUBLE<br>TRIPLE<br>}<br><br>where<br>PROGRAM Begins each logical record in the dataset with a carriage control character.<br>SINGLE Forces single spaced output.<br>DOUBLE Forces double spaced output.<br>TRIPLE Forces triple spaced output. |
| <b>Example</b>     | //OUTDS8 OUTPUT CONTROL=PROGRAM                                                                                                                                                                                                                                                    |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                              |

## COPIES

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p>Specifies the number of copies of the SYSOUT dataset to be printed. JES retransmits the document for the specified number of copies.</p> <p>If printing is duplex and more than one copy is specified, you may need to include dataset separators or the SIDE=NUFRONT extended JCL keyword to insure that the first page of each copy begins on the front side of the page.</p> <p>Using COPIES in conjunction with the XCOPY extended JCL keyword is not recommended. If you use both keywords, the total number of copies will be the product of the two. Also, your banner, separator, and message pages may print out of sequence.</p>                                                                                                  |
| <b>Scope</b>               | Affects processing of DJDE, page-formatted, and AFP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Syntax</b>              | <p><b>For DJDE data streams:</b></p> <p>COPIES=<i>nnn</i></p> <p><b>For page-formatted and AFP data streams:</b></p> $\text{COPIES} = \left\{ \begin{array}{c} \textit{nnn} \\ (\textit{group-value1}[, \dots, \textit{group-value8}]) \end{array} \right\}$ <p>where</p> <p><i>nnn</i>           The number of copies of the SYSOUT dataset to be printed. For JES2, you can specify a value from 1 through 255; for JES3, you can specify a value from 0 through 255.</p> <p><i>group-value</i>   The number of copies of each page to be printed before the next page is printed. For JES2, you can specify a value from 1 through 255; for JES3, you can specify a value from 1 through 254. You can code a maximum of 8 group-values.</p> |
| <b>Example</b>             | //OUT2 OUTPUT COPIES=3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Related information</b> | See also the STAPLE and XCOPY extended JCL keywords.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## DATAACK

---

**Description** Indicates whether data-off-page or invalid character error messages are reported or blocked.

If an existing form contains any errors, you should specify DATAACK=UNBLOCK, and the REVOVLY extended JCL keyword will determine the error.

**For page-formatted data streams:**

DATAACK processing is not performed for forms.

**Scope** Affects processing of page-formatted and AFP data streams sent to all types of printers.

**Syntax** DATAACK=  $\left\{ \begin{array}{l} \text{BLOCK} \\ \text{UNBLOCK} \\ \text{BLKCHAR} \\ \text{BLKPOS} \end{array} \right\}$

where

BLOCK Blocks all error messages.

UNBLOCK Reports all error messages.

BLKCHAR Blocks invalid-character errors; in XPAF, reports data-off-page error messages.

BLKPOS Blocks data-off-page errors, but allows invalid character messages. No messages are printed in XPAF.

**Example** //OUT1 OUTPUT DATAACK=BLOCK

**Overrides** None.

**Related information** See also the VPA initialization and printer profile parameters. For AFP data streams, these restrictions apply:

- For centralized and decentralized printers, the paper size specified within XPAF must correspond to the paper size being used at the printer. Additionally, overlays that are converted for one paper size can be used in a document with a different paper size only if you specify the REVOVLY extended JCL keyword.
- For centralized and decentralized printers, overlays cannot be used with different PMODEs. For example, an overlay converted with IBMPMODE, PMODE=LAND, or in short edge feed documents can be used only with PMODE=PORT or long edge feed documents if you specify the REVOVLY extended JCL keyword.
- For decentralized printers, for previously unvalidated overlays, the dimensions of images for any included page segments are not known. If the origin of the image lies within the valid printable area, it will be printed without causing a hardware error.
- For decentralized printers, if you have problems with an unvalidated converted overlay, you should reconvert the overlay via the REVOVLY extended JCL keyword.

## DEPT

|                            |                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies a department identification to be used on the separator pages of an output dataset. This value also is available in user exit 05 for constructing customized banner pages.                                                                                                                                                        |
| <b>Scope</b>               | For JES2 and JES3 systems running at version 4.2 or higher, affects processing of all types of data streams sent to centralized printers. Also affects processing of all types of data streams sent to decentralized and PCL-capable printers if you have changed the SETC statement in sample user exit XUXIT05B from 'REMOTE' to 'LOCAL'. |
| <b>Syntax</b>              | DEPT='string'<br><br>where<br><br>'string' The 1- to 60-character department identification enclosed in single quotation marks. The department identification can include alphanumeric or national (\$, #, @) characters.                                                                                                                   |
| <b>Example</b>             | //OUT2 OUTPUT DEPT='PAYROLL'                                                                                                                                                                                                                                                                                                                |
| <b>Overrides</b>           | You can override this keyword by specifying a value in the XODBDPTT field in @XODB in user exit 02.                                                                                                                                                                                                                                         |
| <b>Related information</b> | Refer to <a href="#">Section Two: Installing and Customizing XPAF</a> for more information about user exits. Review the comments in the appropriate sample user exit member in XPFSAMP for more information on how to modify the sample.                                                                                                    |

## DEST

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <p>Selects a specific printer from the group of printers defined by an output class. If the output class contains only one Xerox printer, you do not need to specify a destination.</p> <p><b>For DJDE data streams when running in XJCF simulation mode:</b></p> <p>Determines which DJDEs are generated for an XJCF simulation job, based on the entries for the DEST in the XJCFSIM table.</p> |
| <b>Scope</b>       | Affects processing of all types of data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                    |
| <b>Syntax</b>      | DEST= <i>printer-name</i><br><br>where<br><br><i>printer-name</i> A specific printer from the group of printers defined by an output class.                                                                                                                                                                                                                                                       |
| <b>Example</b>     | //OUT2 OUTPUT CLASS=A,DEST=PRNTR1                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                                                                                                             |

## FCB

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p>Specifies the Forms Control Buffer (FCB) image that JES uses to print a SYSOUT dataset. The FCB image specifies the form length and LPI to print.</p> <p>If the JCL for an AFP data stream includes the FCB IBM JCL keyword but not the PAGEDEF IBM JCL keyword, the FCB value is used as a PAGEDEF value. However, the FCB value is not used as a PAGEDEF value if either of these two conditions exist:</p> <ul style="list-style-type: none"> <li>• If FCB=Y is included in the initialization or printer profile parameters</li> <li>• If XJCF simulation processing is in effect</li> </ul> |
| <b>Scope</b>               | Affects processing of DJDE data streams sent to centralized printers, AFP data streams sent to all types of printers, and XJCF simulation jobs sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Syntax</b>              | <p>FCB=<i>fcf-name</i></p> <p>where</p> <p><i>fcf-name</i> The 1- to 4-character name of the FCB image. The name can include alphanumeric or national (\$, #, @) characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Example</b>             | //OUT2 OUTPUT FCB=ABC1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Overrides</b>           | This keyword overrides the FCB initialization and/or printer profile parameters. An FCB IBM JCL keyword on a SYSOUT DD statement overrides an FCB IBM JCL keyword on the OUTPUT statement.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Related information</b> | See also the PAGEDEF and SYSFCB initialization parameters and the PAGEDEF IBM JCL keyword.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## FLASH

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <p>Specifies the Xerox form to be used. FLASH support must be active in the FORMDEF for the document, and the FLASH name must be identical to the forms name. Ensure that the centralized Xerox form has been loaded to the native form library.</p> <p>If FLASH specifies the same name as the SYSFLSH initialization parameter, the FLASH name is ignored. To use the FLASH name for AFP processing, the SYSFLSH initialization parameter and the FLASH IBM JCL keyword must specify different names.</p> |
| <b>Scope</b>       | Affects processing of AFP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Syntax</b>      | <p>FLASH=<i>form-name</i></p> <p>where</p> <p><i>form-name</i> The 1- to 4-character form name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character.</p>                                                                                                                                                                                                                                                                   |
| <b>Example</b>     | //OUT2 OUTPUT FLASH=FRM1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## FORMDEF

---

|                    |                                                                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the AFP resource that defines the appearance of the page on the form. XPAF automatically retrieves the form definition during printing.<br>If you are using inline resources, the form definition name can either match the resource name in the inline resource, or it can be set to 'dummy.' |
| <b>Scope</b>       | Affects processing of AFP data streams sent to all types of printers.                                                                                                                                                                                                                                    |
| <b>Syntax</b>      | FORMDEF= <i>resource-name</i><br><br>where<br><i>resource-name</i> The 1- to 6-character resource name. The name can include alphanumeric characters.                                                                                                                                                    |
| <b>Example</b>     | //OUT1 OUTPUT DEST=PRNTR2,FORMDEF=010110                                                                                                                                                                                                                                                                 |
| <b>Overrides</b>   | This keyword overrides the FORMDEF initialization parameter.                                                                                                                                                                                                                                             |

## FORMS

---

|                    |                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Determines which DJDEs are generated for an XJCF simulation job, based on the entries for the form in the XJCFSIM table.                                                                                                        |
| <b>Scope</b>       | Affects processing of XJCF simulation mode, VIPP, and DJDE data streams.                                                                                                                                                        |
| <b>Syntax</b>      | FORMS= <i>form-name</i><br><br>where<br><i>form-name</i> The 1- to 8-character form name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character. |
| <b>Example</b>     | //OUT2 OUTPUT FORMS=STMT99                                                                                                                                                                                                      |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                           |

## LINECT

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the maximum number of lines JES will print on each output page.<br><br>There is no DJDE to replace the LINECT IBM JCL keyword. XPAF maintains the line count for documents as follows: if a skip-to-channel-n is encountered, it is honored, and the current line count is reset to zero. When the number of lines printed equals the line count value passed to XPAF by JES, a skip-to-channel-1 is generated. If you enter a line count value of 0, the skip-to-channel-1 feature is disabled. |
| <b>Scope</b>               | Affects processing of all types of data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Syntax</b>              | LINECT= <i>nnn</i><br><br>where<br><br><i>nnn</i> 0 through 255. Specify LINECT=0 when using the BOF extended JCL keyword.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Example</b>             | //OUT2 OUTPUT LINECT=50                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                    |                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies up to three e-mail addresses that can be used by XPAF in the “CC”, copies, field of a generated e-mail.                                            |
| <b>Scope</b>       | Affects processing of all documents sent via e-mail.                                                                                                         |
| <b>Syntax</b>      | MAILCC=(emailaddr[,emailaddr[,emailaddr]])<br><br>where<br><i>emailaddr</i> The 1- to 90-character email address to be used in the “cc” field of the e-mail. |
| <b>Default</b>     | None                                                                                                                                                         |
| <b>Example</b>     | //OUT1 OUTPUT<br>MAILCC=('john.smith@example.net',accts@example.net)                                                                                         |
| <b>Overrides</b>   | None.                                                                                                                                                        |

## MAILFILE

---

|                    |                                                                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the file name to be used by XPAF when the document is attached to an e-mail. Since the file type is generated by XPAF based on the output type of the file, do not include the file type in the MAILFILE keyword. |
| <b>Scope</b>       | Affects processing of all documents sent via e-mail.                                                                                                                                                                        |
| <b>Syntax</b>      | MAILFILE='filename'<br><br>where<br><i>filename</i> The 1- to 90-character file name that will be used when the document is attached to the e-mail.                                                                         |
| <b>Default</b>     | The JES job name from the job that generated the output.                                                                                                                                                                    |
| <b>Example</b>     | //OUT1 OUTPUT MAILFILE=('AcctMonthEnd(Oct08)')                                                                                                                                                                              |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                       |

## MAILFROM

---

|                    |                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the e-mail addresses that will be used by XPAF in the “From” field of a generated e-mail.                                            |
| <b>Scope</b>       | Affects processing of all documents sent via e-mail.                                                                                           |
| <b>Syntax</b>      | MAILFROM=(emailaddr)<br><br>where<br><i>emailaddr</i> The 1- to 90-character email address that will be used in the “From” field of the e-mail |
| <b>Default</b>     | The value for the MAILFROM parameter specified in the EMAILADR table.                                                                          |
| <b>Example</b>     | //OUT1 OUTPUT MAILFROM='xpaf40.sys01@example.net'                                                                                              |
| <b>Overrides</b>   | None.                                                                                                                                          |

## MAILTO

---

|                    |                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies up to three e-mail addresses that can be used by XPAF in the “To” field of a generated e-mail.                                                            |
| <b>Scope</b>       | Affects processing of all documents sent via e-mail.                                                                                                                |
| <b>Syntax</b>      | MAILTO=(emailaddr[,emailaddr[,emailaddr]])<br><br>where<br><i>emailaddr</i> The 1- to 90-character email address that will be used in the “to” field of the e-mail. |
| <b>Default</b>     | The value derived from matching USER field in the EMAILADDR table.                                                                                                  |
| <b>Example</b>     | //OUT1 OUTPUT<br>MAILTO=('john.smith@example.net',accts@example.net)                                                                                                |
| <b>Overrides</b>   | None.                                                                                                                                                               |

## NAME

---

|                            |                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p>Specifies a descriptive name to be used on the separator pages of an output dataset. This value also is available in user exit 05 for constructing customized banner pages.</p> <p>For JES2 systems, if you omit the NAME IBM JCL keyword, XPAF uses the PROGRAMMER NAME field from the job card for this value.</p>                     |
| <b>Scope</b>               | For JES2 and JES3 systems running at version 4.2 or higher, affects processing of all types of data streams sent to centralized printers. Also affects processing of all types of data streams sent to decentralized and PCL-capable printers if you have changed the SETC statement in sample user exit XUXIT05B from 'REMOTE' to 'LOCAL'. |
| <b>Syntax</b>              | <p>NAME='string'</p> <p>where</p> <p>'string' The 1- to 60-character name enclosed in single quotation marks. The name can include alphanumeric or national (\$, #, @) characters.</p>                                                                                                                                                      |
| <b>Example</b>             | //OUT2 OUTPUT NAME='Mr. T. Smith'                                                                                                                                                                                                                                                                                                           |
| <b>Overrides</b>           | You can override this keyword by specifying a value in the XODBNAMT field in @XODB in user exit 02.                                                                                                                                                                                                                                         |
| <b>Related information</b> | Refer to <a href="#">Section Two: Installing and Customizing XPAF</a> for more information about user exits. Review the comments in the appropriate sample user exit member in XPFSAMP for more information on how to modify the sample.                                                                                                    |

## NOTIFY

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <p>Identifies up to four user IDs to be notified of a print job's status. When this keyword is included on the JCL OUTPUT statement, a message is displayed on the identified users' consoles.</p> <ul style="list-style-type: none"> <li>For JES2 systems, the status message is issued when all the SYSOUT datasets for an output group have finished printing.</li> <li>For JES3 systems, the status message is issued when the SYSOUT datasets for one job on a specific printer have finished printing.</li> </ul> |
| <b>Scope</b>       | Affects processing of all types of data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Syntax</b>      | <p>NOTIFY=(userid1[,...,userid4])</p> <p>where</p> <p>userid The 1- to 7-character valid TSO user ID that the system will notify. The <i>userid</i> can include alphanumeric characters.</p>                                                                                                                                                                                                                                                                                                                            |
| <b>Example</b>     | //OUT2 OUTPUT NOTIFY=(PGREENE,RBLACK)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p><b>For DJDE and page-formatted data streams:</b></p> <p>Instructs the system to recognize the font index byte in the input data stream. If you are using font indexing in the input data stream to select the fonts for a document, you must specify the DCB option OPTCD=J on the SYSOUT DD statement in the JCL used to submit this job. Alternatively, you can use the TRC IBM JCL keyword.</p> <p><b>For AFP data streams:</b></p> <p>Specifies whether a TRC is contained in each logical record. You must specify the DCB option OPTCD=J on the SYSOUT DD statement in the JCL used to submit this job. The TRC selects a font for the logical record based on the fonts specified by the CHARS IBM JCL keyword or the page definition. XPAF recognizes the TRC in the print data stream. Alternatively, you can use the TRC IBM JCL keyword.</p> |
| <b>Scope</b>               | Affects processing of DJDE, page-formatted, and AFP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Syntax</b>              | <p>OPTCD=<i>font-index</i></p> <p>where</p> <p><i>font-index</i>    The font index.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Example</b>             | //SYSUT2 DD DCB=(OPTCD=J)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <p>Specifies the AFP resource that defines how the line data is placed on a logical page. XPAF automatically retrieves the specified page definition for AFP line format data. If you are using inline resources, the page definition name can either match the resource name in the inline resource, or it may be set to 'dummy'.</p> <p>If PAGEDEF specifies the same name as the SYSFCB initialization parameter, the PAGEDEF name is ignored. To use the PAGEDEF name for AFP processing, the SYSFCB initialization parameter and the PAGEDEF IBM JCL keyword must specify different names.</p> <p>If you include the FCB IBM JCL keyword in your JCL but not the PAGEDEF IBM JCL keyword, XPAF uses the FCB value as a PAGEDEF value unless you included FCB=Y in the initialization or printer profile parameters or XJCF simulation processing is in effect.</p> |
| <b>Scope</b>       | Affects processing of AFP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## PRMODE

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Identifies the process mode required to print this dataset.<br><br>For any dataset that contains DJDE extended JCL keywords or contains a DJDE identifier in the first data record, XPAF assumes DJDE processing even if you specify PRMODE=LINE. However, AFP parameters override this processing. For example, for any dataset that contains AFP extended JCL keywords or contains a X'5A' carriage control in the first data record, XPAF assumes AFP processing no matter what you specify in PRMODE. |
| <b>Scope</b>               | Affects processing of line-mode, DJDE, XES, AFP, and VIPP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Syntax</b>              | $\text{PRMODE} = \left\{ \begin{array}{l} \text{DJDE} \\ \text{LINE} \\ \text{PAGE} \\ \text{VIPP} \end{array} \right\}$ <p>where</p> <p>DJDE Specifies DJDE processing. For non-AFP data streams, this value forces DJDE processing for jobs sent to decentralized and PCL-capable printers.</p> <p>LINE Specifies line-mode processing.</p> <p>PAGE Specifies AFP processing.</p> <p>VIPP Specifies VIPP processing.</p>                                                                                |
| <b>Example</b>             | //OUT2 OUTPUT PRMODE=LINE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Overrides</b>           | AFP processing overrides all other data stream processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Related information</b> | Refer to <a href="#">Section Four: Printing Documents with XPAF</a> for more information about how XPAF determines the processing mode.                                                                                                                                                                                                                                                                                                                                                                   |

## ROOM

---

|                            |                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p>Specifies a room identification to be used on the separator pages of an output dataset. This value also is available in user exit 05 for constructing customized banner pages.</p> <p>For JES2 systems, if you omit the ROOM IBM JCL keyword, XPAF uses the four-character ROOM field defined in the JES2 accounting parameter from the job card for this value.</p> |
| <b>Scope</b>               | For JES2 and JES3 systems running at version 4.2 or higher, affects processing of all types of data streams sent to centralized printers. Also affects processing of all types of data streams sent to decentralized and PCL-capable printers if you have changed the SETC statement in sample user exit XUXIT05B from 'REMOTE' to 'LOCAL'.                             |
| <b>Syntax</b>              | <p>ROOM='string'</p> <p>where</p> <p>'string' The 1- to 60-character room identification enclosed in single quotation marks. The room identification can include alphanumeric or national (\$, #, @) characters.</p>                                                                                                                                                    |
| <b>Example</b>             | //OUT2 OUTPUT ROOM='301 West Side'                                                                                                                                                                                                                                                                                                                                      |
| <b>Overrides</b>           | You can override this keyword by specifying a value in the XODBROMT field in @XODB in user exit 02.                                                                                                                                                                                                                                                                     |
| <b>Related information</b> | Refer to <a href="#">Section Two: Installing and Customizing XPAF</a> for more information about user exits. Review the comments in the appropriate sample user exit member in XPFSAMP for more information on how to modify the sample.                                                                                                                                |

## TITLE

---

|                            |                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies a descriptive title to be used on the separator pages of an output dataset. This value is also available in user exit 05 for constructing customized banner pages.                                                                                                                                                                |
| <b>Scope</b>               | For JES2 and JES3 systems running at version 4.2 or higher, affects processing of all types of data streams sent to centralized printers. Also affects processing of all types of data streams sent to decentralized and PCL-capable printers if you have changed the SETC statement in sample user exit XUXIT05B from 'REMOTE' to 'LOCAL'. |
| <b>Syntax</b>              | TITLE='string'<br><br>where<br><br>'string' The 1- to 60-character title enclosed in single quotation marks. The title can include alphanumeric or national (\$, #, @) characters.                                                                                                                                                          |
| <b>Example</b>             | //OUT2 OUTPUT TITLE='Quarterly Report'                                                                                                                                                                                                                                                                                                      |
| <b>Overrides</b>           | You can override this keyword by specifying a value in the XODBTLET field in @XODB in user exit 02.                                                                                                                                                                                                                                         |

## TRC

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <p><b>For DJDE and page-formatted data streams:</b></p> <p>Instructs the system to recognize the font index byte in the input data stream. If you are using font indexing in the input data stream to select the fonts for a document, you must specify TRC=YES on the SYSOUT DD statement in the JCL used to submit this job. Alternatively, you can use the OPTCD IBM JCL keyword.</p> <p><b>For AFP data streams:</b></p> <p>Specifies whether a Table Reference Character (TRC) is contained in each logical record. The TRC selects a font for the logical record based on the fonts specified by the CHARS IBM JCL keyword or the page definition. XPAF recognizes the TRC in the print data stream. Alternatively, you can use the OPTCD IBM JCL keyword.</p> |
| <b>Scope</b>       | Affects processing of DJDE, page-formatted, and AFP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Syntax</b>      | $TRC = \left\{ \begin{array}{l} YES \\ NO \end{array} \right\}$ <p>where</p> <p>YES XPAF recognizes the TRC in the print data stream.</p> <p>NO XPAF does not recognize the TRC in the print data stream.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                            |                                                                     |
|----------------------------|---------------------------------------------------------------------|
| <b>Example</b>             | //OUT2 OUTPUT CLASS=A,DEST=PRINTR1,<br>// CHARS=(GA15,PB12),TRC=YES |
| <b>Overrides</b>           | None.                                                               |

## UCS

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the Universal Character Set (UCS) that JES uses to print a SYSOUT dataset.<br><br>When processing AFP data streams, the CHARS IBM JCL keyword overrides all UCS IBM JCL keywords if CHARS is used on either a SYSOUT DD statement or OUTPUT JCL statement. If your JCL includes UCS but not CHARS, the UCS value is not used as a CHARS value if UCS=Y is included in either the initialization or printer profile parameters. |
| <b>Scope</b>               | Affects processing of DJDE and AFP data streams sent to centralized printers.                                                                                                                                                                                                                                                                                                                                                            |
| <b>Syntax</b>              | UCS= <i>char-set</i><br>where<br><i>char-set</i> Universal character set JES uses to print a SYSOUT dataset.                                                                                                                                                                                                                                                                                                                             |
| <b>Example</b>             | //OUT2 OUTPUT UCS=AA11                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Overrides</b>           | This keyword overrides the UCS initialization and/or printer profile parameters. A UCS IBM JCL keyword on a SYSOUT DD statement overrides a UCS IBM JCL keyword on the OUTPUT statement.                                                                                                                                                                                                                                                 |
| <b>Related information</b> | See also the SYSFONT initialization parameter and the CHARS IBM JCL keyword.                                                                                                                                                                                                                                                                                                                                                             |

## USERDATA

---

|                            |                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies user-defined information to be used on the separator pages of an output dataset. This value is also available in user exit 05 for constructing customized banner pages.                                                                                                                                 |
| <b>Scope</b>               | For JES2 and JES3 systems running at version 4.2 or higher, affects processing of all types of data streams sent to centralized printers. Also affects processing of all types of data streams sent to all printers if you have changed the SETC statement in sample user exit XUXIT05B from 'REMOTE' to 'LOCAL'. |
| <b>Syntax</b>              | <p>USERDATA=('string1'[,...,'string16'])</p> <p>where</p> <p>'string' The 1- to 60-character string enclosed in single quotation marks. Each string can include alphanumeric or national (\$, #, @) characters.</p>                                                                                               |
| <b>Example</b>             | <pre>//OUT2 OUTPUT USERDATA=('SENSITIVE DATA.', // 'DO NOT THROW AWAY.', // 'THIS DATA MUST BE DESTROYED', // 'IN ACCORDANCE WITH', // 'COMPANY REGULATIONS.')</pre>                                                                                                                                              |
| <b>Overrides</b>           | You can override this keyword by specifying a value in the XODBUSRT field in @XODB in user exit 02.                                                                                                                                                                                                               |
| <b>Related information</b> | Refer to <a href="#">Section Two: Installing and Customizing XPAF</a> for more information about user exits. Review the comments in the appropriate sample user exit member in XPFSAMP for more information on how to modify the sample.                                                                          |

## USERLIB

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b> | <p>Specifies up to eight alternate resource libraries to use when printing documents.</p> <p><b>For page-formatted data streams:</b></p> <p>These libraries may contain page formats. No other resources are supported for this keyword.</p> <p>When a page format is required by a job and you specify this keyword, XPAF first searches the datasets specified by USERLIB for the requested page format. If the page format does not exist in any of these datasets, XPAF then searches the appropriate libraries listed in the XOSF start-up proc.</p> <p>Any resource downloaded from the page format will be deleted from the printer when the job is completed.</p> <p><b>For AFP data streams:</b></p> <p>These libraries may contain any or all of the following resource types: PAGEDEFs, FORMDEFs, page segments, and overlays. USERLIB capability for fonts is not supported.</p> <p>When a resource is required by a job and you specify this keyword, XPAF first searches the datasets specified by USERLIB for the requested resource. If the resource does not exist in any of these datasets, XPAF then searches the appropriate libraries listed in the XOSF start-up proc.</p> <p>If XPAF uses a resource from a library specified in USERLIB, the associated resources are deleted from the printer when the job is completed. Also, the associated resources are not stored in the native libraries.</p> |
| <b>Scope</b>       | Affects processing of AFP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Example</b>     | <pre>//OUT2 OUTPUT USERLIB=('USER.PAGEFORM', // 'TEST.PAGEFORM')</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 43. XPAF extended JCL keywords

XPAF extended JCL keywords provide XPAF with job- and output-specific values. For example, you can set XSHADE=Y in your initialization parameters so that cells are enhanced within AFP images, but you can set XSHADE=N in your extended JCL so that, for a specific job, cells are not enhanced within AFP images.

### *Specifying XPAF extended JCL keywords*

---

Unless otherwise noted, XPAF will recognize and process extended JCL keywords coded on either the OUTPUT or SYSOUT DD statements.

### *Coding XPAF extended JCL keywords*

---

XPAF follows standard IBM JCL coding conventions. Items such as commas, equal signs, parentheses, and asterisks are required entries and must be coded exactly as they appear in the syntax definitions.

Default values do not exist for variables of extended JCL keywords. Therefore, when specifying multiple variables for an extended JCL keyword, you cannot omit any values. For example, this is not a valid statement:

```
//REPORT1 OUTPUT RTEXT=('TAX REPORT',,33,24,2)
```

For detailed information on coding JCL, refer to the appropriate IBM JCL reference manual.

### *DJDE data streams*

---

For DJDE data streams, extended JCL keywords override any corresponding DJDE keywords included in the initial packet of a document. These extended JCL keywords can be coded only on the OUTPUT statement.

If your document contains an initial DJDE packet, make sure it is coded so that it combines correctly with the DJDEs generated by the XPAF extended JCL. For example, when the FONTS statement contains multiple fonts and exceeds the size of one DJDE record, you must use multiple FONTS statements. Each DJDE statement must end with a semicolon ( ; ) or a comma and a semicolon ( , ; ). Refer to the DJDE section of your printer manual for more information about coding DJDEs.

## *Parameter/keyword processing hierarchy*

---

XPAF allows you to specify, at three different levels, certain controls used in processing documents. The levels are:

- Initialization parameters which establish system-wide defaults
- Printer profile parameters which establish printer specific defaults
- Extended JCL keywords which establish job specific values

In general, XPAF processes parameters and keywords according to this hierarchy:

- Printer profile parameters override initialization parameters.
- Extended JCL keywords override initialization and/or printer profile parameters.

Exceptions to this rule are noted in this chapter.

## *XPAF extended JCL support*

---

The following extended JCL keywords are supported by XPAF.

## BANSTYLE

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Identifies the banner page style to be produced by XPAF when header, dataset, or trailer pages are requested. This value also is available in user exits 02 and 05 for constructing customized banner pages.                                                                                                                                                                                                                                                                                                                                                      |
|                            | <p><b>For DJDE data streams:</b></p> <p>No DJDE is created.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Scope</b>               | Affects processing of all types of data streams sent to centralized printers. Also affects processing of all types of data streams sent to all printers if you have changed the SETC statement in sample user exit XUXIT05B from 'REMOTE' to 'LOCAL'.                                                                                                                                                                                                                                                                                                             |
| <b>Syntax</b>              | <p>BANSTYLE=<i>style-name</i></p> <p>where</p> <p><i>style-name</i> The 1- to 4-character user-defined banner page style name used in user exits 02 and 05. The name can include alphanumeric, national (\$, #, @), or special characters.</p> <p>The two system-defined banner page style names are JES and XPAF. JES specifies the JES banner page style, and XPAF specifies the XPAF banner page style. For BANSTYLE=JES, only applies to JES2 and JES3 systems at version 4.2 or higher. If BANSTYLE=NONE is specified, no banner pages will be produced.</p> |
| <b>Example</b>             | <p>//REPORT OUTPUT BANSTYLE=PAY1</p> <p>In this example, PAY1 is passed to the XDIBBANS field in @XDIB in user exits 02 and 05. You can code user exit 05 to give you additional banner page styles. User exit 05 could generate a special payroll banner page if it detected PAY1 in the XDIBBANS field.</p>                                                                                                                                                                                                                                                     |
| <b>Overrides</b>           | This keyword overrides the BANSTYLE initialization and/or printer profile parameters. You can override this keyword by specifying a value in the XDIBBANS field in @XDIB in user exit 02.                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Related information</b> | Refer to <a href="#">Section Two: Installing and Customizing XPAF</a> for more information about user exits. Review the comments in the appropriate sample user exit member in XPFSAMP for more information on how to modify the sample.                                                                                                                                                                                                                                                                                                                          |

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the names of up to three forms to be printed on the back side of a duplex page. The BFORM DJDE is created.                                                                                                                                                                                                                                                                                                        |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                       |
| <b>Syntax</b>      | BFORM $n$ =( <i>form-name</i> , <i>value1</i> , <i>value2</i> )<br><br>where<br><br><i>n</i> 1 through 3.<br><br><i>form-name</i> The 1- to 6-character form name. The name can include alphanumeric or national (\$, #, @) characters.<br><br><i>value1</i> 1 through 250. The beginning copy number to which the form applies.<br><br><i>value2</i> 1 through 250. The number of copies to which a specified form applies. |
| <b>Example</b>     | //REPORT1 OUTPUT BFORM1=(XVGB,1,2),<br>// BFORM2=(XVRL,3,3)                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                                                                                                                                        |

## BOF

---

|                            |                                                                                                                                                                                                                 |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the number of lines from the top of the page to the last print line on the page (bottom of form). When using this keyword, set the JES line count parameter to 0 (LINECT=0). The BOF DJDE is created. |
| <b>Scope</b>               | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                          |
| <b>Syntax</b>              | BOF= <i>nnn</i><br><br>where<br><br><i>nnn</i> 0 through 255.                                                                                                                                                   |
| <b>Example</b>             | //REPORT OUTPUT BOF=66                                                                                                                                                                                          |
| <b>Overrides</b>           | None.                                                                                                                                                                                                           |
| <b>Related information</b> | See also the LINECT IBM JCL keyword and the TOF extended JCL keyword.                                                                                                                                           |

## CHAN01–CHAN12

---

|                    |                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Assigns a carriage control value to a channel assignment. You can assign up to eight values per channel assignment. The ASSIGN DJDE is created. |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                          |
| <b>Syntax</b>      | CHANnn=(value1[,...,value8])<br><br>where<br>nn        01 through 12.<br>value    1 through 255.                                                |
| <b>Example</b>     | <pre>//REPORT OUTPUT CHAN01=(1,5,10,25), // CHAN02=(30,35,40)</pre>                                                                             |
| <b>Overrides</b>   | None.                                                                                                                                           |

## CLUSTRTB

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p>Identifies the cluster mapping table used by XPAF to map a centralized paper tray cluster name to a paper tray on a decentralized or PCL-capable printer.</p> <p>This table resides in the library specified in the XOSF start-up proc DD statement named by the PAPTBLDD initialization or printer profile parameter.</p> <p><b>For DJDE data streams:</b></p> <p>No DJDE is created.</p> |
| <b>Scope</b>               | Affects processing of DJDE data streams sent to decentralized and PCL-capable printers.                                                                                                                                                                                                                                                                                                       |
| <b>Syntax</b>              | CLUSTRTB=table-name<br><br>where<br>table-name The 1- to 16-character table name. The name can include alphanumeric or national (\$, #, @) characters.                                                                                                                                                                                                                                        |
| <b>Example</b>             | <pre>//REPORT OUTPUT CLUSTRTB=PRTR001</pre>                                                                                                                                                                                                                                                                                                                                                   |
| <b>Overrides</b>           | This keyword overrides the CLUSTRTB printer profile parameter.                                                                                                                                                                                                                                                                                                                                |
| <b>Related information</b> | <p>If a document being printed includes a PDL-defined paper size that is not supported by the target printer as defined in the cluster mapping table, document processing is terminated. Refer to <a href="#">Section Three: Managing Resources with XPAF</a> for more information on paper-related table processing.</p>                                                                     |

## CME

---

|                    |                                                                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the copy modification entry (CME) to be used for printing this document. The MODIFY DJDE is created.                                         |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                  |
| <b>Syntax</b>      | CME= <i>copymod</i><br><br>where<br><i>copymod</i> The 1- to 8-character CME name. The name can include alphanumeric or national (\$, #, @) characters. |
| <b>Example</b>     | //REPORT OUTPUT CME=CDOD03                                                                                                                              |
| <b>Overrides</b>   | None.                                                                                                                                                   |

## COLLATE

---

|                    |                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies whether the printed output is collated. The COLLATE DJDE is created.                                                                                                 |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                                         |
| <b>Syntax</b>      | COLLATE= $\left\{ \begin{array}{l} \text{YES} \\ \text{NO} \end{array} \right\}$<br><br>where<br>YES      Collates printed output.<br>NO      Does not collate printed output. |
| <b>Example</b>     | //REPORT OUTPUT COLLATE=Y                                                                                                                                                      |
| <b>Overrides</b>   | None.                                                                                                                                                                          |

## COLORIMG (for AFP data streams)

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>         | <p>Identifies the color to be applied to images for this job; the color of the images is not changed permanently. You may specify any highlight color or black.</p> <ul style="list-style-type: none"> <li>• If the image is monochrome, this color overrides the existing color.</li> <li>• If the image is two-color, this color overrides the highlight color. The black portion of the image still prints as black.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Scope</b>               | Affects processing of AFP data streams sent to centralized highlight color printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Syntax</b>              | <p>COLORIMG=<i>color</i></p> <p>where</p> <p><i>color</i>    The 1- to 6-character color name. The name can include alphanumeric or national (\$, #, @) characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Example</b>             | <p>//OUT2 OUTPUT COLORIMG=BLUE</p> <p>This example replaces the existing color (including black) with blue if the image is monochrome, or overrides the highlight color with blue if the image is two-color.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Related information</b> | <p>These conditions apply:</p> <ul style="list-style-type: none"> <li>• This keyword has no effect on images embedded within a form that is printed as a .FRM, since the images are not referenced independently in the data stream.</li> <li>• If you specify MERGEOVL=Y in your initialization parameters, printer profile, or extended JCL, COLORIMG has no affect on images within forms. However, other image resources will be affected.</li> <li>• This keyword does not apply color to text. If a converted AFP resource contains both image and text elements, color will be applied to the images, but not to the text.</li> <li>• Solid horizontal and vertical lines within a converted AFP overlay are processed as text; therefore, color is not applied to them.</li> <li>• The highlight color loaded on the printer will determine the color of the image.</li> <li>• For documents containing images colorized via the IID structured field, if there are multiple .IMG images and or text which contain different highlight colors within the same job, the printer will not be able to reconcile the conflict. As a result, either an error may occur at the printer or some of the color images may print as black. For additional information on using color images, refer to “Using color images” in <a href="#">Section Four: Printing Documents with XPAF</a>.</li> </ul> |

## COLORIMG (for DJDE data streams)

---

|                    |                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the color to be applied to IMAGE DJDE records that are not already coded with an INKREF name. You can specify up to eight ink and image name pairs. Additionally or alternatively, you can specify an ink name to be applied to any images that are not already coded with color. No DJDE is created. This command modifies existing IMAGE and GRAPHIC DJDEs. |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to centralized highlight color printers.                                                                                                                                                                                                                                                                                    |

|                    |                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the beginning location and length of printable data within an input record. The DATA DJDE is created.                                                                                                                                                                                                                                                                                             |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                      |
| <b>Syntax</b>      | DATA=( <i>value1</i> , <i>value2</i> )<br><br>where<br><br><i>value1</i> 0 through 254. The starting location of the print data within an input record.<br><br><i>value2</i> 0 through 255. The length of the data to be printed. XPAF limits the length to 255; however, in ONLINE mode using optimization (the normal XPAF mode), the printer limit is 214. Any characters beyond this limit are ignored. |
| <b>Example</b>     | //REPORT OUTPUT DATA=(2,130)                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                                                                                                                       |

## DELFONT

---

**Description** Downloads the named font to the printer from the appropriate native font library. The font is deleted from the printer after the document has been printed. You can specify up to eight font names.

**For DJDE data streams:**

The FILE DJDE is created.

**Scope** Affects processing of all types of data streams sent to centralized printers.

**Syntax** DELFONT=(*font-name1*[,...,*font-name8*])

where

*font-name* The 1- to 6-character font name. The name can include alphanumeric characters and can include these wildcard characters:

- \* Used to specify all fonts, or used in combination with a generic name to specify a group of fonts. Example: FONT\*
- ? Used as a positional wildcard character within a font name. Example: FNT?BC

**Example** //OUT1 OUTPUT DELFONT=FNTABC

**Overrides** None.

## DELFORM

---

**Description** Downloads the named form to the printer from the appropriate native form library. The form is deleted from the printer after the document has been printed. You can specify up to eight form names.

**For DJDE data streams:**

The FILE DJDE is created.

**Scope** Affects processing of all types of data streams sent to centralized printers.

**Syntax** DELFORM=(*form-name1*[, ..., *form-name8*])

where

*form-name* The 1- to 6-character form name. The name can include alphanumeric characters and can include these wildcard characters:

- \* Used to specify all forms, or used in combination with a generic name to specify a group of forms. Example: FORM\*
- ? Used as a positional wildcard character within a form name. Example: FRM?BC

**Example** //OUT1 OUTPUT DELFORM=FRMABC

**Overrides** None.

## DELIMAGE

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Downloads the named image to the printer from the appropriate native image library. The image is deleted from the printer after the document has been printed. You can specify up to eight image names.<br><br><b>For DJDE data streams:</b><br>The FILE DJDE is created.                                                                                                                                                                                                               |

## DJDE

---

|                    |                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies whether XPAF creates dynamic job descriptor entries (DJDEs) from extended JCL for the document at print time. Unless you specify DJDE=NO, DJDEs will be created from extended JCL at print time. No DJDE is created. |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                                         |
| <b>Syntax</b>      | DJDE= { $\left. \begin{array}{l} \text{YES} \\ \text{No} \end{array} \right\}$ }<br><br>where<br>YES Creates DJDEs at print time.<br>No Does not add DJDEs to the user's data stream.                                          |
| <b>Example</b>     | //REPORT OUTPUT DJDE=NO                                                                                                                                                                                                        |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                          |

## DJDESCAN

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Indicates whether the performance option of not processing duplicate DJDEs found in large print datasets is to be used. If used, duplicate DJDEs found in a dataset will not be parsed and processed for resource requirements repeatedly by XOSF. These DJDEs will still be sent to the printer, so the print job will not be compromised in any way. This can cause a big performance enhancement on very large print jobs that repeatedly use the same DJDEs. Note that the XOSF page and/or impression counts may be slightly off because DUPLEX=YES or NO will not be recognized by XOSF in this case. |
| <b>Scope</b>       | Affects processing of EBDIC DJDE streams sent to centralized printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Syntax</b>      | DJDESCAN={ Y or N }<br><br>where<br>Y        Activates the DJDE scanning feature so that duplicate DJDEs will not be parsed.<br>N        All DJDEs are parsed.                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Overrides</b>   | This keyword overrides the DJDESCAN printer profile parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## DUPLEXSW

---

|                            |                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Indicates whether the printer's plexing mode will switch between simplex and duplex.                                                                                                                                                                                                                                                          |
| <b>Scope</b>               | Affects processing of page-formatted and AFP data streams sent to centralized printers.                                                                                                                                                                                                                                                       |
| <b>Syntax</b>              | DUPLEXSW={M, N   Y}                                                                                                                                                                                                                                                                                                                           |
|                            | where                                                                                                                                                                                                                                                                                                                                         |
| YES                        | Switches the printer's plexing mode between simplex and duplex mode based on the value specified for DUPLEX in each individual copy group.                                                                                                                                                                                                    |
| No                         | Does not switch the printer's plexing mode. XPAF searches the FORMDEF to determine if DUPLEX is specified in any of the copy groups. If it is, the entire document will be printed in duplex mode. Any simplex copy groups will be printed with blank back pages. If DUPLEX is not specified, the entire document is printed in simplex mode. |
| M                          | Switches the printer between simplex and duplex and also print simplex pages in a DUPLEX copygroup in simplex mode, rather than in DUPLEX with a SIDE=NUFRONT.                                                                                                                                                                                |
| <b>Example</b>             | //REPORT OUTPUT DUPLEXSW=Y                                                                                                                                                                                                                                                                                                                    |
| <b>Overrides</b>           | This keyword overrides the DUPLEXSW initialization and/or printer profile parameters.                                                                                                                                                                                                                                                         |
| <b>Related information</b> | For more information about printing duplex documents, refer to <a href="#">Section Four: Printing Documents with XPAF</a> .                                                                                                                                                                                                                   |

|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the printer tray from which paper will be selected, or the name or reference ID of the paper to be used. The FEED DJDE is created.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Scope</b>               | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Syntax</b>              | $\text{FEED} = \left\{ \begin{array}{c} \text{AUX} \\ \text{MAIN} \\ \text{OPR} \\ \text{stock-ref} \end{array} \right\}$ <p>where</p> <p>AUX            Uses the auxiliary tray for this printer.</p> <p>MAIN           Uses the main tray for this printer.</p> <p>OPR            Uses the tray specified by the printer default.</p> <p><i>stock-ref</i>    The 1- to 6-character stock reference name. The name can include alphanumeric or national (\$, #, @) characters. Uses the tray that contains a specified paper type.</p> |
| <b>Example</b>             | //REPORT OUTPUT FEED=MAIN                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Overrides</b>           | The FEED extended JCL keyword overrides both the printer default and the FEED JDE/JDL command.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Related information</b> | For cluster mapping tables, any value you enter here must match a valid entry in the currently active cluster mapping table.                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b> | Specifies up to 16 fonts to be used during a print job and, optionally, the line spacing to be used with each font. The FONTS DJDE is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Syntax</b>      | <p>FONT<math>nn</math>=(<i>font-name</i>,[<i>spacing</i>,[<i>unit-measure</i>]])</p> <p>where</p> <p><math>nn</math>                    0 through 15.</p> <p><i>font-name</i>            The 1- to 6-character font name. The name can include alphanumeric characters.</p> <p><i>spacing</i>                A number specifying the lines per inch or the dots per line to be used for line spacing. If you specify a decimal value, use the letter P to identify the decimal point. Enter a valid value using one of these formats:</p> <p>                          000P01 to 999P99 (for a decimal number)</p> <p>                          000001 to 999999 (for a whole number)</p> <p><i>unit-measure</i>        Specifies the units for <i>spacing</i>. Enter one of these values:</p> <p>                          LPI        Lines per inch (default value)</p> <p>                          DOTS     300 dpi</p> <p>                          XDOTS    600 dpi</p> |
| <b>Examples</b>    | <pre>//REPORT OUTPUT FONT0=(L0112B) //REPORT OUTPUT FONT1=(L0112C,6P5) //REPORT OUTPUT FONT2=(L0112D,50,DOTS)</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## FORMAT

---

|                    |                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the PDE to be used to format a document. The FORMAT DJDE is created.                                                                                                                   |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                            |
| <b>Syntax</b>      | <p>FORMAT=<i>pde-name</i></p> <p>where</p> <p><i>pde-name</i>            The 1- to 6-character name for the desired PDE. The name can include alphanumeric or national (\$, #, @) characters.</p> |
| <b>Example</b>     | <pre>//REPORT OUTPUT FORMAT=FMT1</pre>                                                                                                                                                            |
| <b>Overrides</b>   | None.                                                                                                                                                                                             |

## ICATALOG

---

|                    |                                                                                                                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the ink catalog to be used when ink references do not specify a catalog. The ICATALOG DJDE is created.                                                                                                       |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to centralized highlight color printers.                                                                                                                                   |
| <b>Syntax</b>      | ICATALOG= <i>inkcat</i><br><br>where<br><i>inkcat</i> The 1- to 6-character ink catalog name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic character. |
| <b>Example</b>     | //REPORT1 OUTPUT ICATALOG=CAT001                                                                                                                                                                                        |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                   |

## IDFAULT

---

|                    |                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the ink to be used when an ink is not specified in a resource; for example, a page number where no ink has been specified in the NUMBER DJDE or extended JCL keyword. The IDFAULT DJDE is created.            |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to centralized highlight color printers.                                                                                                                                    |
| <b>Syntax</b>      | IDFAULT= <i>inkref-name</i><br><br>where<br><i>inkref-name</i> The 1- to 6-character ink name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic character. |
| <b>Example</b>     | //REPORT1 OUTPUT IDFAULT=BLUE                                                                                                                                                                                            |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                    |

## IDR

---

|                    |                                                                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the ink descriptor name. The IDR DJDE is created.                                                                                                       |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to centralized highlight color printers.                                                                             |
| <b>Syntax</b>      | IDR= <i>inkdesc</i><br><br>where<br><i>inkdesc</i> The 1- to 32-character existing IDR name. The name can include alphanumeric or national (\$, #, @) characters. |
| <b>Example</b>     | //REPORT OUTPUT IDR=GALLEYJET545                                                                                                                                  |
| <b>Overrides</b>   | None.                                                                                                                                                             |

## IFONTRES

---

|                            |                                                                                                                                                                                                                                                                                              |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies which of the user's AFP font libraries is to be referenced at print time. A value of 240 indicates use of the font library defined by the IBMFONTDD initialization parameter. A value of 300 indicates use of the font library defined by the IBMFONT300 initialization parameter. |
| <b>Scope</b>               | Affects processing of AFP data streams sent to all types of printers.                                                                                                                                                                                                                        |
| <b>Syntax</b>              | IFONTRES= $\left\{ \begin{array}{l} 240 \\ 300 \end{array} \right\}$<br><br>where<br>240     Indicates that the 240 dpi font library is used<br>300     Indicates that the 300 dpi font library is used                                                                                      |
| <b>Default</b>             | 240                                                                                                                                                                                                                                                                                          |
| <b>Example</b>             | IFONTRES=300                                                                                                                                                                                                                                                                                 |
| <b>Overrides</b>           | This keyword overrides the IFONTRES initialization and/or printer profile parameter.                                                                                                                                                                                                         |
| <b>Related information</b> | See also the IBMFONTDD and IBMFONT300 initialization parameters.                                                                                                                                                                                                                             |

## ILIST

---

|                    |                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies up to eight ink reference names to be used in an ink table and referenced by the ink index. The ILIST DJDE is created.                                                                                             |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to centralized highlight color printers and decentralized full color printers.                                                                                                  |
| <b>Syntax</b>      | <p>ILIST=(<i>inkref-name1</i>[,...,<i>inkref-name8</i>])</p> <p>where</p> <p><i>inkref-name</i>      The 1- to 6-character existing ink table name. The name can include alphanumeric or national (\$, #, @) characters.</p> |
| <b>Example</b>     | //REPORT OUTPUT ILIST=(RED,BLUE,GREEN)                                                                                                                                                                                       |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                        |

| <b>Description</b> | Defines image positioning and color parameters for the named image. The IMAGE DJDE is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Syntax</b>      | <p>IMAGE=(<i>image-name</i>,<i>vpos</i>,<i>unit-measure</i>,<i>hpos</i>,<i>unit-measure</i>,<i>hold</i>,<i>scaling</i>[(<i>table-name1</i>,...,<i>table-name8</i>)])</p> <p>where</p> <p><i>image-name</i>      The 1- to 6-character image name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character.</p> <p><i>vpos</i>              The vertical offset of the image from the logical page origin.</p> <p><i>hpos</i>              The horizontal offset of the image from the logical page origin.</p> <p>For <i>vpos</i> and <i>hpos</i>, if you specify a decimal value, use the letter P to identify the decimal point. Enter a valid value using one of these formats:</p> <p>000P01 to 999P99 (for a decimal number)<br/>000001 to 999999 (for a whole number)</p> <p><i>unit-measure</i>      The unit of measure for the <i>vpos</i> and <i>hpos</i> values. You must specify the units for both the <i>vpos</i> and <i>hpos</i> variables. Enter one of these values:</p> <p>CM              Centimeters<br/>DOTS          300 dpi<br/>IN              Inches<br/>XDOTS        600 dpi</p> |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>hold</i>       | Indicates whether the image will be printed on all pages. Enter one of these values:<br><br>HOLD      Prints on all pages<br>NOHOLD   Prints on one page                                                                                                                                                                                                                                                                                                                         |
| <i>scaling</i>    | Indicates whether the image is to be scaled. <ul style="list-style-type: none"> <li>When printing on centralized printers, enter a fraction in the form <math>n/d</math>. Both <math>n</math> and <math>d</math> must be integers in the range of 1 to 8, thereby specifying a value from 1/8 to 8.</li> <li>When printing on decentralized printers, enter 1, 2, or 4. The default is 1. Due to printer image processing limitations, no other values are supported.</li> </ul> |
| <i>table-name</i> | Optional, for highlight color printing only. The 1- to 6-character ink table name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic character. You can specify up to eight ink tables.                                                                                                                                                                                                                             |

**Examples**    //REPORT OUTPUT IMAGE=(IMG1,2,IN,1P5,IN,HOLD,1)  
                  //REPORT OUTPUT IMAGE=(IMG2,5P2,IN,3,IN,HOLD,1,  
                  // (INKS,RED,BLUE,GREEN))

**Overrides**    None.

## IMGTYPE

---

**Description** Specifies whether to convert AFP images from their original resolution to 300 dpi.

**NOTE:** If you have previously scaled an image using a product other than XPAF, the quality of that image rescaled through XPAF may not match the original.

---

**Scope** Affects processing of AFP data streams sent to all types of printers.

**Syntax** 
$$\text{IMGTYPE} = \left\{ \begin{array}{c} 0 \\ 1 \\ 3 \end{array} \right\}$$

where

- 0 Does not scale the image dimension but does scale the position of the image. Image position scaling allows the image to print in the correct relative location on the page when printed on a Xerox printer as opposed to printing on an IBM printer. Image position scaling is increased by a factor of 25%.

For some IM-type images, image dimension scaling does occur when specifying 0. For example, non-page segment images that include shading are scaled. For these exceptions, image dimension scaling is increased by a factor of 25%.

**NOTE:** If you specify 0, the size of the converted image will print smaller in XPAF (by a factor of 20%) than the original 240 dpi image printed in AFP.

---

- 1 Scales the image dimension and image position of an AFP image to 300 dpi before sending it to the printer. IOCA-encoded images are scaled from any resolution to 300 dpi. All other AFP images are scaled from 240-to-300 dpi, an increase of 25%.
- 3 Scales the image dimension and image position of an AFP image to 300 dpi based on the current L-units value specified in the IDD or IID structured field of the image. IOCA-encoded images are scaled from any resolution to 300 dpi. For IM-type images, any L-units value that does not specify 300 dpi is assumed to be 240 dpi.

**Default** 0

**Example** IMGTYPE=1

**Overrides** This keyword overrides the IMGTYPE initialization and/or printer profile parameters.

**Related information** See also the IMAGEPROC and IMAGETONE printer profile parameters.

## INKINDEX

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the field within a user record which contains the index to a specific ink reference name. The INKINDEX DJDE is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to centralized highlight color printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Syntax</b>      | $\text{INKINDEX} = \left\{ \begin{array}{c} \text{NONE} \\ (value1, value2, value3) \end{array} \right\}$ <p>where</p> <p><b>NONE</b> Overrides an existing ink index value (for example, one specified in the PDL).</p> <p><i>value1</i> 0 through 250. Indicates the byte position relative to zero of the ink index value.</p> <p><i>value2</i> 0 or 1. Indicates the initial value of the index:</p> <p>0 Indicates that a font index of 0 is associated with the first entry in the font list.</p> <p>1 Indicates that a font index of 1 is associated with the first font.</p> <p><i>value3</i> 1 through 7. Indicates the number of low order bits in the ink index byte to be used as the ink index value.</p> |
| <b>Examples</b>    | <pre>//REPORT OUTPUT INKINDEX=NONE //REPORT OUTPUT INKINDEX=(10,0,3)</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## INKXLIB

---

|                    |                                                                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the DD statement that defines the library where the color cross-reference tables are stored.                                                                                                                     |
|                    | <p><b>For DJDE data streams:</b></p> <p>No DJDE is created.</p>                                                                                                                                                            |
| <b>Scope</b>       | Affects processing of DJDE, page-formatted, and AFP data streams sent to centralized highlight color printers, and processing of DJDE data streams sent to decentralized full color printers.                              |
| <b>Syntax</b>      | <p>INKXLIB=<i>ddname</i></p> <p>where</p> <p><i>ddname</i> The 1- to 8-character DD name. The DD name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic character.</p> |
| <b>Example</b>     | <pre>//REPORT OUTPUT INKXLIB=INKXLIB1</pre>                                                                                                                                                                                |
| <b>Overrides</b>   | This keyword overrides the INKXLIB initialization and/or printer profile parameters.                                                                                                                                       |

## INKXREF

---

**Description** Identifies the name of the color cross-reference table, and optionally, alters the color cross-references within the table for the current document only. You can specify up to eight pairs of old and new inks.

### For DJDE data streams:

No DJDE is created. This command allows inline modification of any ink reference name on any DJDE statement to the new ink reference name specified in the table.

**Scope** Affects processing of DJDE, page-formatted, and AFP data streams sent to centralized highlight color printers.

**Syntax** INKXREF=(*ink-table*['*old1=new1* '['*old8=new8*']'])

where

*ink-table* The name of the color cross-reference table. Enter one of these values:

\* Dynamically creates a new table.

*name* The 1- to 8-character name of an existing color cross-reference table. The name can include alphanumeric or national (\$, #, @) characters.

*old* The 1- to 6-character existing ink reference name that you want to change. The name can include alphanumeric or national (\$, #, @) characters.

*new* The 1- to 6-character new name to be substituted for the old name. The name can include alphanumeric or national (\$, #, @) characters.

**Examples** //REPORT OUTPUT INKXREF=XREF1

This example instructs XPAF to use the color cross-reference table XREF1 stored in INKXLIB.

```
//REPORT OUTPUT INKXREF=(XREF1,('RED=PINK',
// 'BLUE=BLACK'))
```

This example instructs XPAF to use the color cross-reference table XREF1 stored in INKXLIB and substitute PINK for RED and BLACK for BLUE.

```
//REPORT OUTPUT INKXREF=(*,('RED=BLACK'))
```

This example instructs XPAF to create a table dynamically and substitute BLACK for RED.

**Overrides** This keyword overrides the INKXREF initialization and/or printer profile parameters.

## INVERT

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |                                          |      |                                         |      |                                                   |      |                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|------------------------------------------|------|-----------------------------------------|------|---------------------------------------------------|------|---------------------------------------|
| <b>Description</b> | Inverts the image on a physical page by 180 degrees. The INVERT DJDE is created.                                                                                                                                                                                                                                                                                                                                                                          |       |                                          |      |                                         |      |                                                   |      |                                       |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to 4635 and 4635MX printers.                                                                                                                                                                                                                                                                                                                                                                                 |       |                                          |      |                                         |      |                                                   |      |                                       |

| <b>Description</b> | Identifies the job descriptor library (JDL) to be used for this document.<br><br><b>For DJDE data streams:</b><br>The JDL DJDE is created.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Scope</b>       | Affects processing of DJDE, page-formatted, and AFP data streams sent to centralized printers.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Syntax</b>      | JDL= <i>jdl-name</i><br>where<br><i>jdl-name</i> The 1- to 6-character JDL name. The name can include alphanumeric or national (\$, #, @) characters.                                                                                                                                                                                                                                                                                                                                                       |
| <b>Example</b>     | //REPORT OUTPUT JDL=NAME1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Overrides</b>   | The JDL you specify here overrides the default JDL specified by either the: <ul style="list-style-type: none"> <li>• DEFJDL initialization parameter</li> <li>• JDL printer profile parameter</li> <li>• METAJDL initialization and/or printer profile parameter</li> </ul> The JDL must be loaded into the XPAF library (identified by the PDLLIB initialization or printer profile parameter) using the PDL loader. For page-formatted data streams, it also must reference a VOLUME CODE=NONE statement. |

## MAP

|                            |                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Identifies the file name that references a previously created font mapping file in the PDL for the applicable printer. The font mapping file is used for font cross-referencing when feeding the short edge of large paper (for example, 11 by 17 inches) into the printer.<br><br><b>For DJDE data streams:</b><br>The MAP DJDE is created. |
| <b>Scope</b>               | Affects processing of DJDE data streams sent to 4635, 4635MX, and 4135 printers.                                                                                                                                                                                                                                                             |
| <b>Syntax</b>              | MAP= <i>file-name</i><br>where<br><i>file-name</i> The 1- to 6-character file name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic character.                                                                                                                                |
| <b>Example</b>             | //REPORT OUTPUT MAP=NAME1                                                                                                                                                                                                                                                                                                                    |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                                        |
| <b>Related information</b> | For more information, refer to the <i>Xerox 4135 Laser Printing System PDL/DJDE Reference Version 3</i> .                                                                                                                                                                                                                                    |

## MARGIN

---

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |              |                                                                                                                                                                                                                                          |                     |                                                                                                                                                                                                                     |     |                     |    |        |     |                     |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p>Indicates whether overlays will be consolidated.</p> <p>Include MERGEVL=Y in your JCL if you want to merge all the overlays in a copy group the first time that the copy group is used in a document. Each overlay in the copy group is converted, then the individual converted overlays are consolidated into a single .FRM. The .FRM is not saved in the native form library, but will be reused each time the copy group is called. At completion of the document, the .FRM is deleted from the printer. Depending on the complexity of the document, enabling this feature may improve your printer's performance.</p> <p>All of the inline images included in the overlays are consolidated into a single image. The consolidated image can be reused each time the copy group is called. At completion of the document, the consolidated image is deleted from the printer.</p> <p>If you include MERGEVL=N in your JCL, the converted overlays are not consolidated. Instead, only the first converted overlay is processed as a .FRM; subsequent converted overlays are merged with variable data on the page.</p> |
| <b>Scope</b>               | Affects processing of AFP documents that include multiple overlays in a copy group sent to centralized printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Syntax</b>              | $\text{MERGEVL} = \left\{ \begin{array}{l} \text{YES} \\ \text{No} \end{array} \right\}$ <p>where</p> <p>YES      Overlays are consolidated.<br/> No        Overlays are not consolidated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Example</b>             | //REPORT OUTPUT MERGEVL=Y                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Overrides</b>           | This keyword overrides the MERGEVL initialization and/or printer profile parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Related information</b> | If you specify MERGEVL=Y, the COLORIMG extended JCL keyword has no affect on images within forms. However, other image resources will be affected. For more information, see the COLORIMG extended JCL keyword.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>         | Establishes page numbering for the document to be printed. The NUMBER DJDE is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Scope</b>               | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Syntax</b>              | $\text{NUMBER} = \left\{ \begin{array}{c} \text{NO} \\ (value1, value2, value3[, value4, inkref-name]) \end{array} \right\}$ <p>where</p> <p><b>NO</b> Pages are to be unnumbered.</p> <p><i>value1</i> -9999 through 99999. The starting page number, which can be negative or positive. The page number is not printed until it becomes positive, so a negative value creates unnumbered pages up to the page you want numbered.</p> <p><i>value2</i> -250 through 250. The line number, which can be negative or positive, on which each page number should appear.</p> <p><i>value3</i> -250 through 250. The number of the ending column, which can be negative or positive, for the page number sequence.</p> <p><i>value4</i> Optional. 1 through 127. The font index to be used.</p> <p><i>inkref-name</i> Optional, for highlight color printing only. The 1- to 6-character ink reference name of the color in which to print the page number. The name can include alphanumeric or national (\$, #, @) characters.</p> |
| <b>Example</b>             | //REPORT OUTPUT NUMBER=(-1,1,129,1,BLUE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>         | Directs output for a specific job to any combination of file, disk, and physical printer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                            | <b>For DJDE data streams:</b><br>No DJDE is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Scope</b>               | Affects processing of all types of data streams sent to all types of printers with the exception of printers using TCP/IP protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Syntax</b>              | $\text{OPWRITER} = \left\{ \begin{array}{l} \text{TAPE[,ONLY]} \\ \text{DISK[,ONLY]} \\ \text{TAPE,DISK[,ONLY]} \end{array} \right\}$ <p>where</p> <p><b>TAPE<math>n</math></b> Writes the dataset on a tape volume. <math>n</math> is optional and indicates the tape density as defined by the DEN z/OS JCL parameter. XPAF supports tape densities 2, 3, and 4 only.</p> <p><b>DISK</b> Writes the dataset to a disk dataset. XPAF generates an output dataset name in the format <i>prefix.printerid.date.time</i>.</p> <p><b>ONLY</b> Writes the dataset to the TAPE and/or DISK dataset, but not to the printer defined by the printer profile.</p> <p>If you omit ONLY, the document prints on the printer defined in the printer profile in addition to being written to file and/or disk.</p> |
| <b>Example</b>             | //REPORT OUTPUT OPWRITER=(TAPE,DISK,ONLY)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Overrides</b>           | Values specified for OPWRITER are used in addition to or in place of values specified for WRITER. For example, if WRITER=(LOCAL,DISK,ONLINE) is specified in the printer profile and OPWRITER=ONLY is specified in the JCL, the document is written to DISK in online format; no output is printed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

For further information about printing documents from file and/or disk, refer to <a href="#">Section Four: Printing Documents with XPAF</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## OTEXT

---

**Description** Directs a text message to the printer operator during printing.

**For DJDE data streams:**

The OTEXT DJDE is created.

**Scope** Affects processing of DJDE data streams sent to centralized printers.

**Syntax** OTEXT= { NONE  
( 'string', passnum, WAIT) }

where

**NONE** Specifies that no text message is sent to the printer.

**'string'** The 1- to 60-character message enclosed in single quotation marks. In the message, you can include uppercase A-Z, 0-9, and these special characters: @, #, \$, %, &, \*, (, ), \_, -, +, =, :, ", ?, /, a space, and a comma. Refer to the appropriate printer reference manual for information on how to include lowercase letters or any special characters not listed in this definition.

**passnum** END or a number from 1 to 255. The message is displayed on the operator console for the copy number specified or for the last copy if END is specified.

**WAIT** Suspends printing until the printer operator responds with CONTINUE.

**Examples** //REPORT1 OUTPUT OTEXT='PINK PAPER IN TRAY1'  
//REPORT2 OUTPUT OTEXT=('THIRD COPY PRINTING',3)  
//REPORT3 OUTPUT OTEXT=('CHECKS IN TRAY1',1,WAIT)  
//REPORT4 OUTPUT OTEXT=('CHANGE PAPER',END,W)  
//REPORT5 OUTPUT OTEXT=NONE

**Overrides** None.

## OVERPRT

---

| <b>Description</b> | <p>Identifies the page format to be used for this document.</p> <p><b>For DJDE data streams:</b></p> <p>No DJDE is created.</p>                                                                                                                   |
| <b>Scope</b>       | Affects processing of page-formatted data streams sent to all types of printers.                                                                                                                                                                  |
| <b>Syntax</b>      | <p>PAGEFORM=<i>pageform</i></p> <p>where</p> <p><i>pageform</i> The 1- to 8-character page format name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character.</p> |
| <b>Example</b>     | <pre>//REPORT OUTPUT PAGEFORM=NTC1004</pre>                                                                                                                                                                                                       |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                             |

## PALETTE

---

|                    |                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the color palette to be used on the page. The PALETTE DJDE is created.                                                                                                       |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to centralized highlight color printers.                                                                                                   |
| <b>Syntax</b>      | <p>PALETTE=<i>palette</i></p> <p>where</p> <p><i>palette</i> An existing 1- to 6-character color palette name. The name can include alphanumeric or national (\$, #, @) characters.</p> |
| <b>Example</b>     | //REPORT1 OUTPUT PALETTE=SIMPLE                                                                                                                                                         |
| <b>Overrides</b>   | None.                                                                                                                                                                                   |

## PAPERSIZ

---

**Description** Specifies the paper size to be used for this document. The paper loaded in the tray from which this job feeds must be the size you specify here.

**NOTE:** When using manual feed paper, documents should be printed with separators turned off.

---

### For DJDE data streams:

No DJDE is created.

**Scope** Affects processing of all types of data streams sent to all types of printers.

**Syntax** PAPERSIZ=*paper-size*

where *paper-size* is

|        |                        |
|--------|------------------------|
| A3     | 16.54 by 11.69 inches. |
| A4     | 8.27 by 11.69 inches.  |
| A5     | 5.83 by 8.27 inches.   |
| B4     | 9.84 by 13.9 inches.   |
| LEGAL  | 8.5 by 14 inches.      |
| LEGL13 | 8.5 by 13 inches.      |
| LETTER | 8.5 by 11 inches.      |
| LONG   | 11 by 17 inches.       |
| STATMT | 5.5 by 8.5 inches.     |

*paper-name* Any 1- to 6-character alphanumeric, user-defined name from a paper name table.

These values are also supported by decentralized and PCL-capable printers:

|      |                      |
|------|----------------------|
| #7   | 3.78 by 7.5 inches.  |
| #10  | 4.25 by 9.5 inches.  |
| A6   | 4.12 by 5.83 inches. |
| C5   | 6.38 by 9.02 inches. |
| DL   | 4.33 by 8.66 inches. |
| B5   | 6.93 by 9.84 inches. |
| EXEC | 7.25 by 10.5 inches. |
| POST | 3.5 by 5.5 inches.   |

You also can specify PAPERSIZ to match the exact dimensions of any corresponding paper size loaded in your printer. To do so, enter the values for PAPERSIZ as:

PAPERSIZ=(*width,height,unit-measure*)

where

*width* The paper width (x axis).

*height* The paper height (y axis).

*unit-measure* The unit of measure, specified by one of these:

|       |             |
|-------|-------------|
| CM    | Centimeters |
| DOTS  | 300 dpi     |
| IN    | Inches      |
| MM    | Millimeters |
| XDOTS | 600 dpi     |

If you specify a decimal value, use the letter P to identify the decimal point. Enter a valid value using one of these formats:

000P01 to 999P99 (for a decimal number)  
000001 to 999999 (for a whole number)

**Examples** //REPORT OUTPUT PAPERSIZ=LETTER

In this example, the dimensions defined for LETTER in the currently active paper name table are used. If there is no paper name defined or if there is no entry for LETTER in the currently active paper name table, the dimensions shown here for LETTER (8.5 by 11 inches) are used.

//REPORT OUTPUT PAPERSIZ=(9P84,13P9,IN)

In this example, the dimensions 9.84 by 13.9 inches are used.

//REPORT OUTPUT PAPERSIZ=NEWSIZ

In this example, the dimensions for the NEWSIZ user-defined paper name in the currently active paper name table are used.

**Overrides** This value overrides the PAPERSIZ or PAPERHIT and PAPERWID initialization parameters and the PAPERSIZ printer profile parameter.

For paper name tables, if you have modified the dimensions of a paper name in the currently active paper name table, those dimensions will override the default dimensions shown in this Syntax section.

For cluster mapping tables, the value you specify here overrides any paper name values in the currently active cluster mapping table. All other cluster mapping table processing occurs normally. Refer to [Section Three: Managing Resources with XPAF](#) for more information on paper-related table processing.

#### Related information

If you specify a paper name that is defined in a paper name table, make sure that paper name table has been specified in the PAPNAMTB initialization parameter, printer profile parameter, or extended JCL keyword. If you specify a paper name that is not defined in a paper name table, XPAF uses the values shown in this Syntax section to determine the paper size. If the paper name is not listed in the Syntax section, the paper size defaults to 8.5 by 11 inches.

For AFP data streams, XPAF uses the entries in the currently active varying paper size table to determine which tray select command to issue to decentralized and PCL-capable printers. If a valid varying paper size table is not specified, XPAF issues a tray select command based on three criteria: the AFP bin number within the copy group, the paper name specified in PAPERSIZ, and the printer type. Refer to [Section Three: Managing Resources with XPAF](#) for more information on paper-related table processing.

## PAPNAMTB

---

**Description** Identifies the paper name table used by XPAF to determine the physical paper size dimensions that correlate to a specified paper name. The paper name can be specified in the varying paper size tables, in the cluster mapping tables, or by the PAPERSIZ initialization parameter, printer profile parameter, and extended JCL keyword.

This table resides in the library specified in the XOSF start-up proc DD statement named by the PAPTBLDD initialization or printer profile parameter.

**For DJDE data streams:**

No DJDE is created.

**Scope** Affects processing of all types of data streams sent to all types of printers.

**Syntax** PAPNAMTB=*table-name*

where

*table-name* The 1- to 16-character table name. The name can include alphanumeric or national (\$, #, @) characters.

**Example** //REPORT OUTPUT PAPNAMTB=PNAME01

**Overrides** This keyword overrides the PAPNAMTB initialization and/or printer profile parameters.

**Related information** See also the PAPERSIZ initialization parameter, printer profile parameter, and extended JCL keyword. Refer to [Section Three: Managing Resources with XPAF](#) for more information on paper-related table processing.

**NOTE:** XPAF cannot verify that the paper size specified matches the paper actually loaded on the printer.

---

## PCLREQ

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Indicates whether XES-to-PCL conversion is requested, or if the document is converted to the default printer command language or is passed through without conversion.                                                                                                                                                                                                                                            |
|                            | <b>For DJDE data streams:</b><br>No DJDE is created.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Scope</b>               | Affects processing of all types of data streams sent to PCL-capable printers.                                                                                                                                                                                                                                                                                                                                     |
| <b>Syntax</b>              | $\text{PCLREQ} = \left\{ \begin{array}{c} \text{DEFAULT} \\ \text{GEN} \\ \text{PASS} \end{array} \right\}$ <p>where</p> <p>DEFAULT    Converts the document to the default printer command language specified by the PCL printer profile parameter.</p> <p>GEN        Converts the document to PCL5 format.</p> <p>PASS       Indicates that the document is a pass-through job; no conversion is performed.</p> |
| <b>Example</b>             | //OUT2 OUTPUT PCLREQ=GEN                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Overrides</b>           | This keyword overrides the PCLREQ printer profile parameter.                                                                                                                                                                                                                                                                                                                                                      |
| <b>Related information</b> | If you specify PCL=PCL5 in your printer's profile and you have not specified a value for PCLREQ in either your printer's profile or extended JCL, XPAF will set PCLREQ to a value of GEN.                                                                                                                                                                                                                         |

## PDE

---

|                    |                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the page description entry (PDE) to be used to format a document. The FORMAT DJDE is created.                                                               |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                                 |
| <b>Syntax</b>      | <p>PDE=<i>pde-name</i></p> <p>where</p> <p><i>pde-name</i>    The 1- to 6-character PDE name. The name can include alphanumeric or national (\$, #, @) characters.</p> |
| <b>Example</b>     | //REPORT OUTPUT PDE=PDE1                                                                                                                                               |
| <b>Overrides</b>   | None.                                                                                                                                                                  |

## PMODE

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |                      |          |                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|----------------------|----------|---------------------|
| <b>Description</b>         | <p>Specifies the hardware page origin (printing orientation) and affects the entire document except for job/dataset separators. The standard origin is the top left corner of the page when P (portrait) is specified for PMODE.</p> <p>If the origin should be the top left corner of a landscape page, set PMODE to L (landscape). When an original document is wider than it is tall (deep), set PMODE=L. For example, specify PMODE=L for a document that has been designed for a continuous-forms printer on which letter-size paper is fed sideways to reduce meter usage.</p> <p>The settings for PMODE in XPAF are equivalent to the PSF medium orientation, which is described in the MDD structured field description in the <i>Advanced Function Printing: Data Stream Reference</i>.</p> <p><b>For DJDE data streams:</b></p> <p>The PMODE DJDE is created.</p> |           |                      |          |                     |
| <b>Scope</b>               | Affects processing of all types of data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |           |                      |          |                     |

## REVIMAGE

---

**Description** Downloads the named image(s), up to eight, to the printer from the appropriate native image library. For decentralized printers that can permanently store resources, the image is stored on the printer. For centralized printers, the image is stored on the printer unless the printer profile specifies DELIMAGE=YES. Only images that also are referenced in the document are downloaded.

**For DJDE data streams:**

The FILE DJDE is created.

**For AFP data streams:**

The image must be a preconverted page segment that is:

- Stored in the centralized image library
- Called in the input data stream by its page segment name

Also, you must:

- Issue the REFRESH operator command for the appropriate resource libraries.
- Resubmit the job using the appropriate REVxxxxx keywords in the extended JCL.

Using this keyword eliminates the overhead of reconverting a page segment to a Xerox image and storing the image again in a native library during document processing.

**Scope** Affects processing of all types of data streams sent to centralized printers, decentralized printers that can permanently store resources, and PCL-capable printers.

**Syntax** REVIMAGE=(*image-name1*[, ..., *image-name8*])

where

*image-name* The 1- to 6-character image name that can include alphanumeric or national (\$, #, @) characters.

You also can use wildcard characters for documents printed on centralized printers:

- \* Used to specify all images, or used in combination with a generic name to specify a group of images. Example: IMG\*
- ? Used as a positional wildcard character within an image name. Example: IMG?BC

**Example** //OUT1 OUTPUT REVIMAGE=IMGABC

**Overrides** None.

## REVLOGO

---

**Description** Downloads the named logo(s), up to eight, to the printer from the appropriate native logo library. The logo is stored on the printer unless the printer profile specifies DELLOGO=YES. Only logos that are referenced in the document are revised.

**For DJDE data streams:**

The FILE DJDE is created.

**Scope** Affects processing of DJDE and page-formatted data streams sent to centralized printers.

**Syntax** REVLOGO=(*logo-name1*[,...,*logo-name8*])

where

*logo-name* The 1- to 6-character logo name that can include alphanumeric or national (\$, #, @) characters.

You also can use these wildcard characters:

- \* Used to specify all logos, or used in combination with a generic name to specify a group of logos. Example: LOGO\*
- ? Used as a positional wildcard character within a logo name. Example: LGO?BC

**Example** //OUT1 OUTPUT REVLOGO=LGOABC

**Overrides** None.

## REVOPSEG

---

**Description** Specifies whether page segments will be revised when an overlay referring to them is revised.

To use this keyword with an AFP data stream, you must resubmit the job using the appropriate REVxxxxx keywords in the extended JCL.

**Scope** Affects processing of AFP data streams sent to all types of printers.

**Syntax** 
$$\text{REVOPSEG} = \left\{ \begin{array}{l} \text{YES} \\ \text{No} \end{array} \right\}$$

where

**YES** Any page segments referred to by an overlay will be revised during document processing if the REVOVLY extended JCL keyword is included in the JCL used to submit the job.

**No** Any page segments referred to by an overlay will not be revised as a part of REVOVLY processing. However, one or more page segments can still be revised separately using the REVPSEG extended JCL keyword.

**NOTE:** Specifying REVOPSEG=NO is not applicable when the AUTOREV initialization or printer profile parameter is set to either AFP or BOTH. REVOPSEG will default to YES.

---

**Example** //OUT2 OUTPUT REVOPSEG=N

**Overrides** This keyword overrides the REVOPSEG initialization and/or printer profile parameters.

**Related information** See also the REVOVLY and REVPSEG extended JCL keywords and the AUTOREV initialization and printer profile parameters.

## REVOVLY

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p>Converts the named overlay(s), up to eight, to a Xerox form. Any page segments associated with the overlay are converted to Xerox images. If any page segments have already been converted, they will not be revised if REVOPSEG=N is specified. The converted Xerox form and any associated Xerox images are then stored in the appropriate native form and image libraries and downloaded to the printer.</p> <p>Xerox forms are stored in native libraries only when printing to centralized printers. The form is stored on the printer unless the printer profile specifies DELFORM=YES.</p> <p>Xerox images are always stored in native libraries, regardless of whether you are printing to a centralized or a decentralized printer. Any images that are associated with the converted overlay are permanently stored by the printer unless the printer profile specifies DELIMAGE=YES.</p> <p>The specified overlay must be called in the input data stream by its overlay name. Even if the overlay has previously been converted to a Xerox form, this keyword reconverts the overlay, stores the resulting Xerox form and any Xerox images in native libraries, and downloads the new versions of the form and any images to the printer.</p> <p>To use this keyword with an AFP data stream, you must resubmit the job using the appropriate REVxxxxx keywords in the extended JCL.</p> |
| <b>Scope</b>               | Affects processing of AFP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Syntax</b>              | <p>REVOVLY=(<i>overlay-name</i>1[,...,<i>overlay-name</i>8])</p> <p>where</p> <p><i>overlay-name</i>    The 1- to 6-character overlay name, excluding the O1 prefix. The name can include alphanumeric or national (\$, #, @) characters.</p> <p>                    You also can use wildcard characters for documents printed on centralized printers:</p> <ul style="list-style-type: none"> <li>*    Used to specify all overlays or, in combination with a generic name, to specify a group of overlays. Example: OVL*</li> <li>?    Used as a positional character within an overlay name. Example: OVL?BC</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Example</b>             | //OUT1 OUTPUT REVOVLY=OVLABC                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p>Converts the named page segment(s), up to eight, to a Xerox image, stores the converted image in the appropriate native image library, and downloads the image to the printer. The image is stored on the printer unless the printer profile specifies DELIMAGE=YES.</p> <p>The specified page segment must be called in the input data stream by its page segment name. Even if the named page segment has previously been converted to a Xerox image, this keyword reconverts the page segment, stores the resulting Xerox image in a native library, and downloads the new version of the image to the printer.</p> <p>To use this keyword with an AFP data stream, you must resubmit the job using the appropriate REVxxxxx keywords in the extended JCL.</p>                                                                                             |
| <b>Scope</b>               | Affects processing of AFP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Syntax</b>              | <p>REVPSEG=(pseg-name1[,...,pseg-name8])</p> <p>where</p> <p><i>pseg-name</i> The 1- to 6-character page segment name that can include alphanumeric or national (\$, #, @) characters:</p> <ul style="list-style-type: none"> <li>• If the page segment member uses the S1 prefix, do not include that prefix in the page segment name you enter here.</li> <li>• If the page segment member does not use the S1 prefix, enter the first six characters of the page segment member.</li> </ul> <p>You also can use wildcard characters for documents printed on centralized printers:</p> <ul style="list-style-type: none"> <li>* Used to specify all page segments or, in combination with a generic name, to specify a group of page segments. Example: PSG*</li> <li>? Used as a positional character within a page segment name. Example: PSG?BC</li> </ul> |
| <b>Example</b>             | //OUT1 OUTPUT REVPSEG=(PSGABC,A1PSGA)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b> | Specifies a text message to be printed on a separate page preceding a report. Do not use this keyword with the RTEXTID extended JCL keyword. If both keywords are specified, the results are unpredictable. The RTEXT DJDE is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Syntax</b>      | $\text{RTEXT} = \left\{ \begin{array}{c} \text{NONE} \\ ('string', passnum, value1, value2, value3) \end{array} \right\}$ <p>where</p> <p><b>NONE</b> Specifies that no text message is sent to the printer.</p> <p><b>'string'</b> The 1- to 60-character message enclosed in single quotation marks. In the message, you can include uppercase A-Z, 0-9, and these special characters: @, #, \$, !, %, &amp;, *, (, ), _, -, +, =, :, ", ?, /, a space, and a comma. Refer to the appropriate printer reference manual for information on how to include lowercase letters or any special characters not listed in this definition.</p> <p><b>passnum</b> ALL or a number from 1 to 255. The message is printed on a separate page preceding the report for the copy number specified or for every copy if ALL is specified.</p> <p><b>value1</b> 1 through 255. The line number at which the text is to begin printing.</p> <p><b>value2</b> 1 through 250. The column number at which the text is to begin printing.</p> <p><b>value3</b> 1 through 127. The index (beginning with 1) of the PDE font in which the text is to print.</p> |
| <b>Examples</b>    | <pre>//REPORT1 OUTPUT RTEXT=('TAX REPORT',1,30,14,2) //REPORT2 OUTPUT RTEXT=('TAX REPORT',ALL,30,24,2) //REPORT3 OUTPUT RTEXT=NONE</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## RTEXTID

---

|                    |                                                                                                                                                                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the name of a cataloged file of RTEXT commands that reside on the printer. Do not use this keyword with the RTEXT extended JCL keyword. If both keywords are specified, the results are unpredictable. The RTEXT DJDE is created. |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                                                      |
| <b>Syntax</b>      | RTEXTID= <i>file-name</i><br><br>where<br><i>file-name</i> The 1- to 6-character name of a previously compiled file. The name can include alphanumeric or national (\$, #, @) characters.                                                   |
| <b>Example</b>     | //REPORT OUTPUT RTEXTID=COVER2                                                                                                                                                                                                              |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                       |

## SF1

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies that XPAF will send a DJDE to the printer to control signal function 1 at the start of a page. This signal is used by the printer to communicate with document finishing equipment that is provided by third-party vendors. XPAF does not determine the function of signal function 1; the function is defined by the document finishing equipment supplied by the third-party vendor. The SF1 DJDE is created. |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to centralized printers using DFA version 4.1 or higher. You must specify FEATURE=DFA in the printer's profile for this keyword to take effect.                                                                                                                                                                                                                              |
| <b>Syntax</b>      | $SF1 = \begin{cases} YES \\ NO \end{cases}$ <p>where</p> <p>YES      Sends the SF1=YES DJDE to the printer to raise (that is, turn on) signal function 1.</p> <p>NO        Sends the SF1=NO DJDE to the printer to lower (that is, turn off) signal function 1.</p>                                                                                                                                                       |
| <b>Example</b>     | //OUT2 OUTPUT SF1=Y                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Overrides</b>   | You can override this keyword by specifying a value in the XDJD SF1 field in @XDJD in user exit 02.                                                                                                                                                                                                                                                                                                                       |

**Related information** See also the FEATURE printer profile parameter.

Refer to [Section Four: Printing Documents with XPAF](#) for more information on using this keyword in your data stream, and refer to [Section Two: Installing and Customizing XPAF](#) for more information on user exits. Review the comments in the appropriate sample user exit member in XPF SAMP for more information on how to modify the sample.

Refer to the finishing equipment documentation supplied by your third-party vendor for more information about the equipment's use of signal functions.

## SF2

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies that XPAF will send a DJDE to the printer to control signal function 2 at the start of a page. This signal is used by the printer to communicate with document finishing equipment that is provided by third-party vendors. XPAF does not determine the function of signal function 2; the function is defined by the document finishing equipment supplied by the third-party vendor. The SF2 DJDE is created.                                                                                                                                                                                 |
| <b>Scope</b>               | Affects processing of DJDE data streams sent to centralized printers using DFA version 4.1 or higher. You must specify FEATURE=DFA in the printer's profile for this keyword to take effect.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Syntax</b>              | $SF2 = \begin{cases} YES \\ NO \end{cases}$ <p>where</p> <p>YES      Sends the SF2=YES DJDE to the printer to raise (that is, turn on) signal function 2.</p> <p>NO        Sends the SF2=NO DJDE to the printer to lower (that is, turn off) signal function 2.</p>                                                                                                                                                                                                                                                                                                                                       |
| <b>Example</b>             | //OUT2 OUTPUT SF2=Y                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Overrides</b>           | You can override this keyword by specifying a value in the XDJD SF2 field in @XDJD in user exit 02.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Related information</b> | <p>See also the FEATURE printer profile parameter.</p> <p>Refer to <a href="#">Section Four: Printing Documents with XPAF</a> for more information on using this keyword in your data stream, and refer to <a href="#">Section Two: Installing and Customizing XPAF</a> for more information on user exits. Review the comments in the appropriate sample user exit member in XPFSAMP for more information on how to modify the sample.</p> <p>Refer to the finishing equipment documentation supplied by your third-party vendor for more information about the equipment's use of signal functions.</p> |

## SHIFT

---

**Description** Specifies a shift of the page data for binding purposes. This option can be used to shift data toward the outer edge of the page, to prevent text from being obscured when pages are bound together or hole-punched. The SHIFT DJDE is created.

**Scope** Affects processing of DJDE data streams sent to all types of printers.

**Syntax** 
$$\text{SHIFT} = \left\{ \begin{array}{c} (value1, value2) \\ \text{YES} \\ \text{NO} \end{array} \right\}$$

where

*(value1,value2)* The displacement, in dots, of the front (value1) and back (value2) of the page.

If you enter only one value, that value is assumed to be an entry for value1. To specify a value for only value2, enter a value for both value1 and value2, but set the value for value1 to 0.

The allowed displacement value can be from -75 dots to 75 dots (.25 inch). The minus sign ( - ) is valid when preceding either value1 or value2. Do not enter a plus sign ( + ) to indicate a positive value. Since the displacement is always calculated in dots, do not specify a unit of measure.

If you specify a decimal value, use the letter P to identify the decimal point. Enter one of these values:

-75P00 to 75P00 (for a decimal number)  
-75 to 75 (for a whole number)

YES Uses the default shift of 75 and -75 dots (75,-75).

NO Does not shift.

**Examples** //REPORT1 OUTPUT SHIFT=YES

In this example, the default shift of 75 dots on both sides of the page is used.

//REPORT1 OUTPUT SHIFT=(50,-50)

In this example, data is shifted 50 dots on both sides of the page.

//REPORT1 OUTPUT SHIFT=NO

In this example, no shift on either side of the page is used.

**Overrides** None.

## SIDE

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies positioning of the first logical page of the document to the first logical page of a physical sheet. The SIDE DJDE is created.                                                                                                                                                                                                                                                                                   |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to printers that support duplex printing.                                                                                                                                                                                                                                                                                                                                     |
| <b>Syntax</b>      | <p>SIDE=(<i>side-opt</i>,<i>offset-opt</i>)</p> <p>where</p> <p><i>side-opt</i>      Selects the physical side for printing. Enter one of these values:</p> <p style="padding-left: 100px;">BACK<br/>NEXT<br/>NUFRONT<br/>NUBACK</p> <p><i>offset-opt</i>    Specifies whether the document is offset in the printer output stacker. Enter one of these values:</p> <p style="padding-left: 100px;">NOFFSET<br/>OFFSET</p> |
| <b>Example</b>     | //REPORT OUTPUT SIDE=(NUF,OFFSET)                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                                                                                                                                      |

## STAPLE

---

### Description

Identifies whether copy sets are stitched on a printer that is configured with a stitcher/stacker.

Staple processing is handled by the PDL on the printer; therefore, when you use the STAPLE extended JCL keyword, you also must:

- Specify FEATURE=STITCHER in the printer profile for the destination printer.
- Specify JDE=*jdename* in the extended JCL. The JDE extended JCL keyword must name a JDE that is coded for stapling.

Xerox supplies a sample JDE called PGSTAP in the XPFSAMP member DFAULT. If desired, you can use your own JDE. The JDE must contain statements similar to:

```
VOLUME CODE=NONE;
```

```
OUTPUT STAPLE=YES,NT01=YES,FACEUP=YES;
```

It must be loaded into the PDL library on the host, downloaded to the printer, and compiled.

Stapling is triggered by the END DOCUMENT (EDT) structured field. When XPAF encounters an EDT structured field, it sends down an RSTACK to initiate stapling at the printer.

When using either the COPIES IBM JCL keyword or the XCOPY extended JCL keyword in conjunction with STAPLE, individual copies will be collated correctly; however, copy sets for each job will be collated differently.

For example, if you specify XCOPY=3 and STAPLE=Y in your JCL, you will receive this output:

If you specify COPIES=3 and STAPLE=Y in your JCL, you will receive this output:

### For DJDE data streams:

No DJDE is created.

### Scope

Affects processing of page-formatted and AFP data streams sent to centralized printers equipped with the stitcher option.

**Syntax**     STAPLE= $\left\{ \begin{array}{l} \text{YES} \\ \text{No} \end{array} \right\}$

where

YES     Copy sets are stitched.  
No     Copy sets are not stitched.

**Example**     //REPORT1 OUTPUT STAPLE=YES,JDE=PGSTAP

**Overrides**    None.

**Related information**    See also the COPIES IBM JCL keyword and the XCOPY extended JCL keyword.

## STOCKS

---

**Description**    Defines the stockset and its associated stock(s) to be used in a report. The STOCKS DJDE is created.

**Scope**          Affects processing of DJDE data streams sent to centralized printers.

**Syntax**        STOCKS=*stockset-name*

where

*stockset-name*    The 1- to 6-character stockset name. The name can include alphanumeric.

**Example**        //REPORT1 OUTPUT STOCKS=STOCK1

**Overrides**    None.

## TOF

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p>Specifies the line with reference to the top of the page on which the first line of text is to print in an overflow condition. The TOF DJDE is created. For TOF to work properly, you must:</p> <ul style="list-style-type: none"> <li>• Set a value for BOF or accept its default value.</li> <li>• Set a JES line count that is equal to zero.</li> </ul> <p>When data overflows the page as defined by the BOF value, then the TOF value is applied on the next page. For more information, refer to the description of BOF/TOF in the appropriate printer manual.</p> |
| <b>Scope</b>               | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Syntax</b>              | <p>TOF=<i>nnn</i></p> <p>where</p> <p><i>nnn</i>     1 through 255.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Example</b>             | //REPORT OUTPUT TOF=1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## TWOUP

---

|                    |                                                                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <p>When XPAF is operating in XJCF simulation mode, TWOUP specifies the presentation of the document on a Xerox centralized printer.</p> <p><b>For DJDE data streams:</b></p> <p>No DJDE is created.</p>                                                       |
| <b>Scope</b>       | Affects processing of XJCF simulation mode and centralized printers.                                                                                                                                                                                          |
| <b>Syntax</b>      | <p>TWOUP=<math>\left\{ \begin{array}{l} \text{YES} \\ \text{No} \end{array} \right\}</math></p> <p>where</p> <p>YES     Two or more logical pages will appear on the physical page.</p> <p>No     Only one logical page will appear on the physical page.</p> |
| <b>Example</b>     | //REPORT OUTPUT TWOUP=YES                                                                                                                                                                                                                                     |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                         |

## VARPAPTB

---

**Description** Identifies the varying paper size table used by XPAF to determine the physical paper size which corresponds to the AFP bin number for the current printer. XPAF evaluates the currently active paper name table to determine the dimensions of the paper name specified in this table.

This table resides in the library specified in the XOSF start-up proc DD statement named by the PAPTBLDD initialization or printer profile parameter.

**Scope** Affects processing of AFP data streams sent to all types of printers.

**Syntax** VARPAPTB=*table-name*

where

*table-name* The 1- to 16-character table name. The name can include alphanumeric or national (\$, #, @) characters.

**Example** //REPORT OUTPUT VARPAPTB=PRTR01A

**Overrides** This keyword overrides the VARPAPTB initialization and/or printer profile parameters.

**Related information** Refer to [Section Three: Managing Resources with XPAF](#) for more information on paper-related table processing.

**NOTE:** XPAF cannot verify that the paper size specified matches the paper actually loaded on the printer.

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | <p>Specifies the number of copies of the document to be printed using the DJDE COPIES function. The COPIES DJDE directs a Xerox centralized printer to print copies of a report or document automatically, without the host having to process the data and transmit it to the printer more than once.</p> <p>This keyword is designed to take advantage of the performance benefits of this feature of Xerox centralized printers. For decentralized and PCL-capable printers, the function of this keyword is simulated by processing and transmitting the data multiple times (as with the COPIES IBM JCL keyword).</p> <p>Using XCOPY in conjunction with the COPIES IBM JCL keyword is not recommended. If you use both keywords, the total number of copies will be the product of the two. Also, your banner, separator, and message pages may print out of sequence.</p> <p><b>For DJDE data streams:</b></p> <p>The COPIES DJDE is created.</p> |
| <b>Scope</b>               | Affects processing of DJDE, page-formatted, and AFP data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b> | Identifies the name of a file you are downloading to the printer. The file can be either card-image or Xerox-labeled. The FILE DJDE is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |   |                    |   |                       |   |                                                       |   |                             |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers. When sent to decentralized or PCL-capable printers only .FRM and .IMG files are recognized and are treated as temporary resources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |   |                    |   |                       |   |                                                       |   |                             |
| <b>Syntax</b>      | $\text{XFILE} = \left\{ \begin{array}{c} \text{NULL} \\ (file\text{-}name, file\text{-}type, file\text{-}format, storage\text{-}option[, nn]) \end{array} \right\}$ <p>where</p> <p><b>NULL</b> For Xerox-labeled files, the DJDE created will be FILE=(). The file name and type can then be retrieved from the label, and multiple labeled files can be downloaded using a single command.</p> <p><i>file-name</i> The 1- to 6-character file name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character.</p> <p><i>file-type</i> The 1- to 3-character file type, which can be any valid file type supported by the printer for file downloading. The type can include alphabetic characters.</p> <p><i>file-format</i> Indicates the file format. Enter one of these values:</p> <table> <tr> <td>C</td><td>Card-image format.</td></tr> <tr> <td>L</td><td>Xerox-labeled format.</td></tr> </table> <p><i>storage-option</i> Indicates the file storage option. Enter one of these values:</p> <table> <tr> <td>D</td><td>Delete the file after this document has been printed.</td></tr> <tr> <td>P</td><td>Store the file permanently.</td></tr> </table> <p><i>nn</i> Indicates the maximum card image count (for card-image files only).</p> | C | Card-image format. | L | Xerox-labeled format. | D | Delete the file after this document has been printed. | P | Store the file permanently. |
| C                  | Card-image format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |   |                    |   |                       |   |                                                       |   |                             |

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the names of up to three forms to be printed on the document. If the document is duplexed, this form will be printed on both sides of the page. To print a different form on the back side of the page, use the BFORMn extended JCL keyword. The FORMS DJDE is created.                                                                                                                                                                                         |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to all types of printers.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Syntax</b>      | <p>XFORMn=(<i>form-name</i>,<i>value1</i>,<i>value2</i>)</p> <p>where</p> <p><i>n</i>                    1 through 3.</p> <p><i>form-name</i>    The 1- to 6-character form name. The name can include alphanumeric or national (\$, #, @) characters.</p> <p><i>value1</i>            1 through 250. The beginning ply (pass number) to which the form applies</p> <p><i>value2</i>            1 through 250. The number of plies (passes) to which the form applies.</p> |

## XJCFSIM

---

|                            |                                                                                                                                                                                                                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Indicates whether XJCF simulation is in effect for this print job.                                                                                                                                                                                                                                                         |
| <b>Scope</b>               | Affects processing of XJCF simulation mode and DJDE data streams sent to all types of printers.                                                                                                                                                                                                                            |
| <b>Syntax</b>              | <p>XJCFSIM={ YES   NO   FIRST }</p> <p>where</p> <p>YES Activates XJCF simulation for this job and overrides any value set in the XJCFMODE printer profile parameter.</p> <p>NO Does not activate XJCF simulation for this job.</p> <p>FIRST Activates XJCF simulation for only the first dataset in the output group.</p> |
| <b>Example</b>             | //REPORT OUTPUT XJCFSIM=Y                                                                                                                                                                                                                                                                                                  |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                      |
| <b>Related information</b> | See also the XJCFMODE printer profile parameter.                                                                                                                                                                                                                                                                           |

## XJOBTMEM

---

|                            |                                                                                                                                                                                                                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies Xerox job ticket information to be retrieved from the dataset defined by LPRDSN.                                                                                                                                                                                                     |
| <b>Scope</b>               | Affects processing of all types of data streams sent to NPS or DocuSP printers.                                                                                                                                                                                                                |
| <b>Syntax</b>              | XJOBTMEM=nnnnnnnn<br><br>where<br><br>nnnnnnnn The 1- to 8-character name for the desired job ticket member name. The name can include alphanumeric or national (\$, #, @) characters.                                                                                                         |
| <b>Example</b>             | XJOBTMEM=XJOBTICK                                                                                                                                                                                                                                                                              |
| <b>Related Information</b> | LPRDSN specifies the name of the PDS in which the member resides. For more information on job tickets see the XJOBTMEM printer profile parameter, and refer to chapter 13, <a href="#">“Setting up PCL-capable printers”</a> in <a href="#">Section Two: Installing and Customizing XPAF</a> . |

## XLCDSHSP

---

|                    |                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the percentage of black coloring to be used when converting LCDS heavy shading to PDF. A lower value will produce lighter shading. A value of 0 will produce white or no shading. A value of 100 will produce a black box. |
| <b>Scope</b>       | Affects processing of all LCDS documents transformed to PDF.                                                                                                                                                                         |
| <b>Syntax</b>      | XLCDSLSP=nnn<br><br>where<br><br>nnn A value in the range 0 to 100 indicating the amount of black to be used in the PDF shading.                                                                                                     |
| <b>Default</b>     | The value specified by the LCDS_Heavy_Shading_Percent printer profile parameter.                                                                                                                                                     |
| <b>Example</b>     | //REPORT OUTPUT XLCDSLSP=50                                                                                                                                                                                                          |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                |

## XLCDLSP

---

|                    |                                                                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the percentage of black coloring to be used when converting LCDS medium shading to PDF. A lower value will produce lighter shading. A value of 0 will produce white or no shading. A value of 100 will produce a black box. |
| <b>Scope</b>       | Affects processing of all LCDS documents transformed to PDF.                                                                                                                                                                          |
| <b>Syntax</b>      | XLCDLSP= <i>nnn</i><br>where<br><i>nnn</i> A value in the range 0 to 100 indicating the amount of back to be used in the PDF shading.                                                                                                 |
| <b>Default</b>     | The value specified by the LCDS_Medium_Shading_Percent printer profile parameter.                                                                                                                                                     |
| <b>Example</b>     | //REPORT OUTPUT XLCDLSP=15                                                                                                                                                                                                            |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                 |

## XLPRMEM

---

|                    |                                                                                                                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the name of the member that contains skeleton JCL that is invoked for BATCH LPR Processing. The member must reside in the PDS dataset referenced by the LPRDSN parameter.                                  |
| <b>Scope</b>       | Affects processing of all documents transmitted via BATCH LPR (TCPMODE=LPR)                                                                                                                                          |
| <b>Syntax</b>      | XLPRMEM=member-name<br>where<br>member-name The 1- to 8-character member name. The name can include alphanumeric or national (\$, #, @) characters. The first character must be an alphabetic or national character. |
| <b>Default</b>     | The value specified by the LPRJCL printer profile parameter.                                                                                                                                                         |
| <b>Example</b>     | XLPRMEM=MYLPRJCL                                                                                                                                                                                                     |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                |

## XLPRQNAM

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the queue name on the LPD server that will receive print jobs. For the default queue name of the printers and interface devices, refer to the applicable vendor documentation.                                                                                                                                                                                                    |
| <b>Scope</b>               | Affects processing of all types of data streams sent to printers using the TCP/LPR or TCP/IP protocols.                                                                                                                                                                                                                                                                                     |
| <b>Syntax</b>              | <p>XLPRQNAM=<i>queue-name</i></p> <p>where</p> <p><i>queue-name</i>      The 1- to 50-character queue name on this printer. The queue name can include alphanumeric, national (\$, #, @), or special characters. Spaces are not valid characters within the queue name.</p>                                                                                                                 |
| <b>Default</b>             | None.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Example</b>             | XLPRQNAM=PASSTHRU                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Related information</b> | <p>See also the XIPADDR, LPRBNDRY, LPRDSN, LPRJCL, TCPMODE, and TCPPORT printer profile parameters for information on setting up your system for TCP printing.</p> <p>For LPR protocol requests, see also the OPDALLOC, OPDUNIT, OPHLQ, and OPVOLSER initialization parameters for information on specifying the characteristics of the interim dataset used during TCP batch printing.</p> |

## XMP

---

|                    |                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Identifies the XMP to be used for this document. Depending on the value specified, the effect is to maximize throughput or minimize toner usage.<br><br><b>For DJDE data streams:</b><br>The XMP DJDE is created.                                                                    |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to centralized highlight color printers.                                                                                                                                                                                                |
| <b>Syntax</b>      | $\text{XMP} = \left\{ \begin{array}{l} \text{NONE} \\ \text{ALL} \end{array} \right\}$<br>where<br>NONE Uses the SYSGENed XMP.<br>ALL When a report requires highlight color mode for any page, all remaining unprinted pages of the report are printed in the highlight color mode. |
| <b>Example</b>     | //REPORT1 OUTPUT XMP=ALL                                                                                                                                                                                                                                                             |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                |

## XPDFDPLX

---

|                            |                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies whether the created PDF document should include blank pages to correctly position front and back sides when the PDF file is printed as a duplex document.                                                                                                                                                     |
| <b>Scope</b>               | Affects processing of all PDF documents.                                                                                                                                                                                                                                                                                |
| <b>Syntax</b>              | $\text{XPDFDPLX} = \left\{ \begin{array}{l} \text{FULL} \\ \text{MIXED} \end{array} \right\}$ <p>where</p> <p><i>FULL</i> or <i>F</i> indicates that blank pages should be inserted into the PDF document.</p> <p><i>MIXED</i> or <i>M</i> indicates that blank pages should not be inserted into the PDF document.</p> |
| <b>Default</b>             | XPDFDPLX=MIXED                                                                                                                                                                                                                                                                                                          |
| <b>Example</b>             | XPDFDPLX=F                                                                                                                                                                                                                                                                                                              |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                   |

|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Description</b>         | Specifies the user password to be used when encrypting a PDF document.                                                                                                 |  |
| <b>Scope</b>               | Affects processing of encrypted PDF documents.                                                                                                                         |  |
| <b>Syntax</b>              | XPDFUPW=user-password<br>where<br>owner-password      The 1- to 32-character owner password. The password can include alphanumeric or special (/ , + , < ) characters. |  |
| <b>Default</b>             | None.                                                                                                                                                                  |  |
| <b>Example</b>             | XPDFUPW='SecureDocument'                                                                                                                                               |  |
| <b>Overrides</b>           | None.                                                                                                                                                                  |  |
| <b>Related information</b> | See also the XPDFPERM and XDPFUPW Extended JCL keywords.<br>A PDF document will only be encrypted if the owner password has been given.                                |  |

## XPDFVIEW

---

|                    |                                                                                                                                                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the viewing orientation of PDF files created from AFP documents. The orientation specified in the MDD structure field for the page will be ignored and the orientation will be set based on the value specified. All pages in the created PDF file will have the same orientation. |
| <b>Scope</b>       | Affects processing of AFP documents converted to PDF.                                                                                                                                                                                                                                        |
| <b>Syntax</b>      | XPDFVIEW={ LANDSCAPE   PORTRAIT }<br>where<br>L or LANDSCAPE    The viewing orientation is set to landscape.<br>P or PORTRAIT     The viewing orientation is set to portrait                                                                                                                 |
| <b>Default</b>     | None.                                                                                                                                                                                                                                                                                        |
| <b>Example</b>     | //REPORT OUTPUT XPDFVIEW=L                                                                                                                                                                                                                                                                   |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                        |

## XPJLMEM

---

|                            |                                                                                                                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies a PJJ member to be retrieved from the dataset defined by LPRDSN.                                                                                                                                            |
| <b>Scope</b>               | Affects processing of all types of data streams sent to PCL-capable printers.                                                                                                                                         |
| <b>Syntax</b>              | XPJLMEM=nnnnnnnn<br>where<br>nnnnnnnn    The 1- to 8-character name for the desired PJJ member name. The name can include alphanumeric or national (\$, #, @) characters.                                             |
| <b>Example</b>             | XPJLMEM=XPJL3COP                                                                                                                                                                                                      |
| <b>Related information</b> | For more information on PJJ see the XPJLMEM printer profile parameter, and refer to chapter 13, “ <a href="#">Setting up PCL-capable printers</a> ” in <a href="#">Section Two: Installing and Customizing XPAF</a> . |

## XSHADE

---

|                    |                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies whether to enhance cells within AFP images that are recognized as a shading pattern.<br><br><b>For DJDE data streams:</b><br>No DJDE is created.                                                                     |
| <b>Scope</b>       | Affects processing of AFP data streams sent to all types of printers.                                                                                                                                                          |
| <b>Syntax</b>      | $\text{XSHADE} = \left\{ \begin{array}{l} \text{YES} \\ \text{NO} \end{array} \right\}$<br>where<br>YES      Shading cells will be enhanced.<br>NO      Shading cells will not be enhanced; standard image processing is used. |
| <b>Example</b>     | //OUT1 OUTPUT XSHADE=NO                                                                                                                                                                                                        |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                          |

## XSHIFT

---

|                    |                                                                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Allows shifting of the image of the form and data on a page in the x-direction. This keyword may be used to shift the image of the data for short-edge binding, finishing, and edgemarking. The XSHIFT DJDE is created.                                                                               |
| <b>Scope</b>       | Affects processing of DJDE data streams sent to 4635 and 4635MX printers.                                                                                                                                                                                                                             |
| <b>Syntax</b>      | $\text{XSHIFT} = \left\{ \begin{array}{l} nn \\ \text{NO} \end{array} \right\}$<br>where<br>nn      An integer from -75 to 75, inclusive. This value specifies a shift amount in the x-direction on the front and back side. Each dot is 1/300 of an inch.<br>NO      Specifies that no shift occurs. |
| <b>Example</b>     | //REPORT1 OUTPUT XSHIFT=-75                                                                                                                                                                                                                                                                           |
| <b>Overrides</b>   | None.                                                                                                                                                                                                                                                                                                 |

## XSPLTMEM

---

|                    |                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------|
| <b>Description</b> | Specifies the trigger definition member name to be used when splitting an LCDS job.               |
| <b>Scope</b>       | Affects processing of LCDS data streams converted to PCL or PDF.                                  |
| <b>Syntax</b>      | <code>XSPLTMEM=memname</code><br><br>where<br><i>memname</i> The 1 to eight character member name |
| <b>Example</b>     | <code>//REPORT1 OUTPUT XSPLTMEM=PAYROLL2</code>                                                   |
| <b>Overrides</b>   | None.                                                                                             |

## XSPPCODE

---

|                            |                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies a one to 12 digit passcode to be used when sending a PCL document to a printer that supports the "Secure Print" feature. |
| <b>Scope</b>               | Affects processing of all PCL documents.                                                                                           |
| <b>Syntax</b>              | XSPPCODE=passcode<br>where<br><i>passcode</i> the 1 to 12 digit pass code                                                          |
| <b>Default</b>             | None                                                                                                                               |
| <b>Example</b>             | //REPORT OUTPUT XSPPCODE=123456789                                                                                                 |
| <b>Overrides</b>           | None.                                                                                                                              |

|                            |                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the TCP/IP port number of this printer. Refer to your DocuPrint NIC documentation to determine the correct port number to use.                                                                                                                                                                                                                                                   |
| <b>Scope</b>               | Affects processing of all types of data streams sent to all printers connected via TCP/IP.                                                                                                                                                                                                                                                                                                 |
| <b>Syntax</b>              | XTCPPORT=nnnnn<br>where<br>nnnnn 0 through 65535.                                                                                                                                                                                                                                                                                                                                          |
| <b>Default</b>             | 515 (For LPR protocol)<br>No default for other protocols.                                                                                                                                                                                                                                                                                                                                  |
| <b>Example</b>             | XTCPPORT=2000                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Overrides</b>           | None.                                                                                                                                                                                                                                                                                                                                                                                      |

## XVIPPMEM

---

|                            |                                                                                                                                                                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>         | Specifies the VIPP member to be retrieved from the dataset defined by LPRDSN.                                                                                                                                                                                              |
| <b>Scope</b>               | Affects processing of line-mode data streams sent to VIPP-enabled printers.                                                                                                                                                                                                |
| <b>Syntax</b>              | <p>XVIPPMEM=nnnnnnnn</p> <p>where</p> <p>nnnnnnnn The 1- to 8-character name for the desired VIPP member name. The name can include alphanumeric or national (\$, #, @) characters.</p>                                                                                    |
| <b>Example</b>             | XVIPPMEM=XPAFJDT                                                                                                                                                                                                                                                           |
| <b>Related Information</b> | <p>LPRDSN specifies the name of the PDS in which the member resides.</p> <p>For more information on VIPP see the PRMODE JCL keyword, and refer to chapter 37, “<a href="#">Printing VIPP documents</a>” in <a href="#">Section Four: Printing Documents with XPAF</a>.</p> |

## 44. Parameter and keyword summary

This appendix lists every initialization parameter, printer profile parameter, IBM JCL keyword, and XPAF extended JCL keyword supported by XPAF in alphabetical order. If an initialization parameter or printer profile parameter has a default value, it is listed. Keywords do not have default values. For more information about a specific parameter or keyword, see the appropriate parameter or keyword chapter in Section Five.

### Summary table

| Parameter/<br>Keyword name | Initialization<br>parameter | Printer<br>profile<br>parameter | IBM JCL<br>keyword | XPAF<br>extended<br>JCL keyword | Parameter default value                                                             |

# Section Six:

## *XPAF Messages*

This section describes the messages that are issued by XPAF software. *It* helps you interpret and respond to the messages you may encounter as you use XPAF. It is designed for system administrators, systems programmers, application programmers, console operators, and any others who are interested in XPAF's message output.

*This section* includes ISPF messages (that is, XOAF and XPFE messages) and XPAF system messages. For a complete definition of these types of messages, refer to chapter 45, "[Message overview](#)."

The messages are grouped by component. Each component's messages are contained in a separate chapter. The chapters are presented in alphabetical order by component name. For example, to find message XDI2610W, first turn to the chapter titled "XDI messages." Then scan the message numbers until you find XDI2610W.

Within a chapter, the messages are listed numerically, in hexadecimal order, by message ID number. For example, in the THM messages chapter, message THM2209E appears before message THM220AE.

Gaps in the numbering order do not imply that messages are missing.

If you need to call Xerox Technical Support, record all message numbers and the corresponding messages so they are available if the support team member asks for them. If a system abend occurs, print and save the SYSUDUMP for problem analysis.

## 45. Message overview

XPAF issues two types of messages: ISPF and system. This section describes the two types of messages and how they are issued.

### ISPF messages

---

XPAF writes ISPF messages only to the TSO terminal; they are not written to the z/OS system log (SYSLOG) nor the XOAF log dataset.

ISPF issues two versions of each message, both of which are provided in this document:

- A short version that appears on the first row of an XOAF panel.
- A long version that appears on the third row of an XOAF panel. This message is displayed only when you press the PF1 key or enter HELP when a short message is displayed.

---

**NOTE:** If you are using the ISPF window “pop-up” option for messages, the long version of the ISPF message can be displayed anywhere on the panel.

---

If the long version of a message overwrites the option or command line, press **ENTER** to refresh the panel display.

This sample panel shows both versions of an ISPF message:

Long ISPF Message

Short ISPF Message

Xerox Output Administrative Facility MISSING REQUIRED ENTRY  
Maintain Resident Font Lists

XOAF008E - ENTER LIST NAME AT THE CURSOR POSITION.  
COMMAND ==>

\* On COMMAND line, enter 'C' to create, 'D' to delete, or 'U' to update a list.

Dataset Name: TABLELIB

List Name:

**NOTE:** Other ISPF messages may be issued from the host system. These messages are issued without a message number and prefix, and include both uppercase and lowercase characters. Because these messages are not issued by XPAF, they are not documented.

## XPAF system messages

---

XPAF system messages may be issued by Xerox Output Administrative Facility (XOAF), Xerox Output Services Facility (XOSF), and Xerox Direct Print Services (XDS).

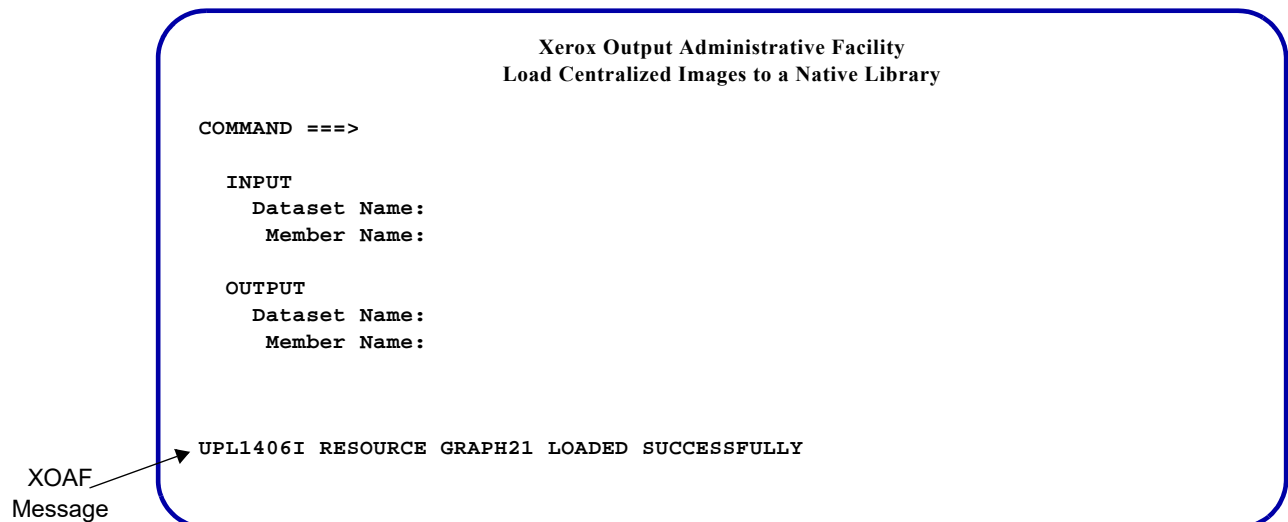

XPAF may issue more than one message for some error conditions. Use the messages collectively to help identify and correct errors.

### XOAF messages

---

XPAF writes XOAF messages to the TSO terminal. Depending on your site's logging setup, XOAF messages may also be written to the z/OS system log (SYSLOG) and/or the XOAF log dataset. For information about message logging, refer to [Section Two: Installing and Customizing XPAF](#).

XOAF system messages that are written to the TSO terminal are issued as interactive, on-screen messages in response to XOAF activities. They are displayed at the bottom of a panel, as shown in this figure:

Some XOAF system messages displayed on your TSO terminal exceed 80 characters, resulting in a truncated message. To read the complete message, access the SYSLOG or XOAF log dataset for your XOAF session.

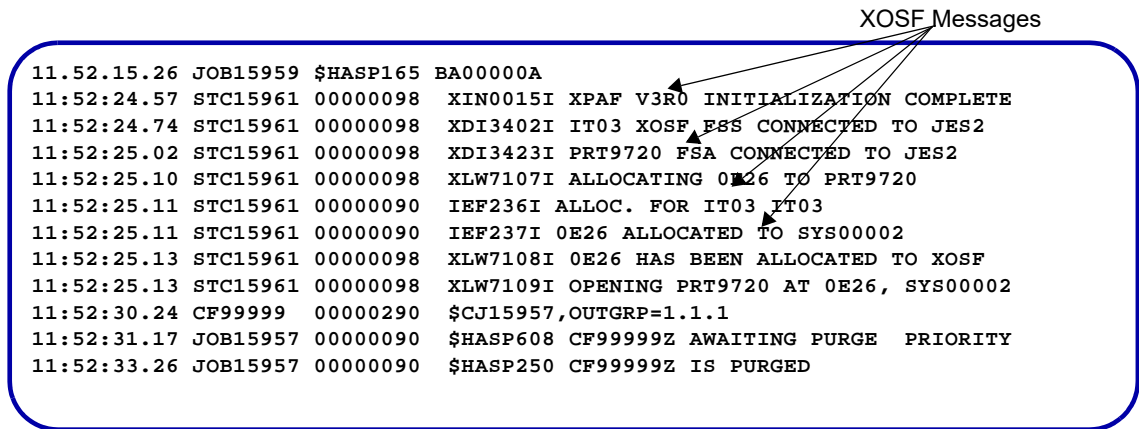

**NOTE:** If you have set up your ISPF user environment to display PF key values at the bottom of every panel, you may not be able to view XOAF system messages.

---

## XOSF messages

XPAF writes XOSF messages to the host operator console. Depending on your site's logging setup, XOSF messages may also be written to the z/OS system log (SYSLOG) and/or the XOSF log dataset. They are displayed within the system log, as shown in this figure:

For information about setting up XOSF logging, refer to [Section Two: Installing and Customizing XPAF](#).

## XDS messages

XDS messages have one of three destinations:

- All subsystem messages concerning initialization, termination, and printer-related status are sent to the z/OS system log.
- All batch job processing messages are sent to the JES message logs.
- All XOSF messages are sent to the XOSF log dataset.

XDS messages are displayed within the system log, as shown in this figure:

## Message format

Each message issued by XPAF has a unique number. This number may, however, be issued by multiple components. The format of the message varies depending on the message type.

**NOTE:** Messages ending with character strings 0001I and 0002I are informational, self-explanatory messages that can be issued by any XPAF component.

## ISPF messages

The long version of each ISPF message is formatted as follows:

*xxxxnnnt msgtext*

where

*xxxx* The alphabetic prefix that identifies the component that issued the message: XOAF or XPFE.

*nnn* The alphanumeric message ID number.

*t* The message type. There are five types of XPAF messages:

- A Write to operator (with reply)
- E Recoverable error
- F Fatal error
- I Informational (console)
- W Warning

*msgtext* The text that appears on the TSO terminal.

The short version of each ISPF message consists of the message text only.

Example:

## XPAF system messages

---

XPAF system messages are formatted as follows:

*xxxxnnnnt msgtext*

where

*xxx*            The alphabetic prefix that identifies the component that issued the message.

*nnnn*           The alphanumeric message ID number.

*t*                The message type. There are five types of XPAF messages:

- A   Write to operator (with reply)
- E   Recoverable error
- F   Fatal error
- I   Informational (console)
- W   Warning

*msgtext*       The text that appears on the console or printout.

Example:

## How to interpret XPAF messages

---

For each message, the following information is provided:

|                  |                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Explanation:     | The explanation provides an interpretation of the message.                                                                                                              |
| System response: | The system response explains how the system reacts to the condition described.                                                                                          |
| User action:     | The user action describes the steps you can take to correct an error condition. If the message is informational (message type I), no user action typically is required. |

## Error, information, and return code values

---

Some XPAF messages contain error codes, information codes, and return codes. These codes define the module from which the message was issued, the severity of the message, and a description of the error. They may be part of the message text that is written to the operator console or the XPAF log.

While some of these codes are generated by XPAF, some are generated by VSAM or other z/OS services. The codes appear in hexadecimal and are indicated by these variables in the message text shown in this document:

- **EC=X'***error code*
- **IC=X'***information code*
- **RC=X'***return code*

You should use the information provided in the explanation, system response, and user action for the message to determine the meaning of the message and what corrective action to take. If you require further help, make a note of the codes and the associated message numbers and call Xerox Technical Support. These values will help the support staff diagnose the error.

## Message conventions

---

The following general conventions have been used in documenting all messages:

- Messages that are displayed on the console or TSO terminal are presented in uppercase, 10-point boldface type in this format:

**UPL1407F FATAL ERROR. UNABLE TO LOAD RESOURCE. SEE LOG**

- If variable information is included in a message, it appears in lowercase, 10-point italic type. For example, message LDM210AW contains this text:

**READ BEYOND END OF FILE FOR *library member name* IN *library ddname/native library***

At the console, the actual member and library name are identified in the message.

- When messages contain hexadecimal values, these values are preceded by an **X** and are surrounded by single quotation marks. For example, **RC=X'return code'** represents a hexadecimal return code value

## LDM messages

---

### **LDM0302E    COULD NOT LOAD** *load module. RC=X'return code'*

Explanation:    During start-up initialization, an error was encountered trying to load a required module into storage.

System response:    XOSF initialization is terminated.

User action:    Verify the region requirements for the XOSF start-up proc. Also verify the XOSF has the proper STEPLIB, LNKLIST, or LPA access to the required modules. Make the necessary changes to the XOSF start-up proc and restart XPAF.

### **LDM0724E    LDM ENCOUNTERED AN ERROR TRYING TO** *activity*

Explanation:    This generic LDM error message was displayed by the XOAF font utility.

System response:    Processing of the IBM font utility (UFTIFL) stops and table building is terminated.

User action:    Check the LDM message in the log to determine if this is a user error.

### **LDM2101E    'library ddname' DD STATEMENT MISSING**

Explanation:    The indicated DDNAME was not found in the z/OS Task I/O Table for the printer.

System response:    The named library cannot be opened.

User action:    Ensure that the DDNAME is present in the XOSF start-up proc. Verify that the initialization and printer profile parameters specifying DDNAMEs are correct.

### **LDM2102E    UNABLE TO DETERMINE DSORG FOR** *library ddname/native library* **DUE TO z/OS SERVICE FAILURE. RC=X'return code'**

Explanation:    This is an internal error.

System response:    The named dataset is not opened.

User action:    Verify that the dataset is specified correctly. If it is, call Xerox Technical Support.

### **LDM2103E    COULD NOT** *function acb/rpl* **CONTROL BLOCK FOR** *library ddname/native library.* **RC=X'return code'; IC=X'information code'**

Explanation:    This is an internal error.

System response:    The named library is not opened.

User action:    Call Xerox Technical Support.

**LDM2104E** **COULD NOT OPEN** *library ddname/native library*. **RC=X**'return code'; **IC=X**'information code'

Explanation: LDM was unable to open the named dataset.  
 System response: The named library is not opened.  
 User action: For a VSAM dataset, refer to the applicable *VSAM Administration: Macro Instruction Reference*. For a PDS, verify that the dataset is available.

**LDM2105E** *library ddname/native library* **IS NEITHER VSAM NOR PDS**

Explanation: This function requires a native library or a PDS, and the named dataset is neither.  
 System response: The named dataset is not opened.  
 User action: Correct the organization of the dataset.

**LDM2106E** *library ddname* **REFERENCES A DEVICE TYPE WHICH IS NOT DASD. DATASET MUST BE DASD-RESIDENT**

Explanation: While determining the unit address of a dataset, the dataset was found not to be disk-resident.  
 System response: The named dataset cannot be opened.  
 User action: Ensure that the dataset is disk-resident.

**LDM2107E** **NO I/O CONTROL BLOCK FOR** *library ddname/native library* **DURING LDM** *function name* **FUNCTION**

Explanation: This message may be preceded by additional messages indicating the cause of the error.  
 System response: The function is terminated. Processing continues.  
 User action: Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**LDM2108W** **A LIST OF DIRECTORY ENTRIES (BUILDIST) WAS REQUESTED FOR AN EMPTY DATASET:** *library ddname/native library*

Explanation: A component requested a list of the directory entries in the named library, but the dataset was empty.  
 System response: Processing continues.  
 User action: If the dataset is not empty, call Xerox Technical Support.

**LDM2109W**    *function REQUESTED FOR library list name IN library ddname/native library BUT member IS NOT OPEN*

Explanation:    This is an internal error.  
System response:    Processing continues.  
User action:    Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**LDM210AW**    **READ BEYOND END OF FILE FOR** *library member name IN library ddname/native library*

Explanation:    This is an internal error.  
System response:    Processing continues.  
User action:    Call Xerox Technical Support.

**LDM210BW**    **COULD NOT DELETE** *library member name IN library ddname/native library DUE TO condition*

Explanation:    LDM could not delete the named member because of one of these conditions:

1.    The specified member was not found in the named library.
2.    A permanent I/O error occurred.
3.    The named library was not open for output.
4.    The named library had insufficient storage space.

System response:    Processing continues.

User action:    These are the possible user actions, which correspond to the Explanation variations (User action #1 matches Explanation #1, and so forth):

1.    Verify the name and spelling of the specified member.
2.    Correct the corrupted file. Corrupted files may need to be recreated or restored from a backup source. If the problem persists, call Xerox Technical Support.
3.    Call Xerox Technical Support.
4.    Increase the storage space in the named library.

**LDM210CE**    **CALLER SUPPLIED RECORD AREA TOO SMALL BY X'number bytes' BYTES FOR** *library member name IN library ddname/native library*

Explanation:    This is an internal error.  
System response:    Processing continues.  
User action:    Call Xerox Technical Support.

**LDM210DI      REQUEST TO RESERVE *resource native library* REFUSED. RESOURCE ALREADY OWNED**

Explanation:      This is an internal error.  
System response:      Processing continues.  
User action:      Call Xerox Technical Support.

**LDM210EW      UNABLE TO RELEASE *resource native library*. RESOURCE NOT OWNED BY TASK**

Explanation:      This is an internal error.  
System response:      Processing continues.  
User action:      Call Xerox Technical Support.

**LDM210FW      *function* FOR member name IN library ddname/native library FAILED DUE TO condition**

Explanation:      One of these conditions exists:

1.    The specified member was not found in the named library.
2.    The dataset specified for the WRITE function has an invalid record length for the specified operation.
3.    In the XOSF start-up proc, you specified a PDS instead of a native library.
4.    The dataset specified is full or is out of directory space.

System response:      Processing continues.

User action:      These are the possible user actions, which correspond to the Explanation variations (User action #1 matches Explanation #1, and so forth):

1.    Verify the name and spelling of the specified member.
2.    Change the record length of the dataset.
3.    Specify a native library in the XOSF start-up proc.
4.    Increase the size of the library.

Check any accompanying messages for related errors.

**LDM2110E      LDM FUNCTION CODE X'*function code*' INVALID**

Explanation:      This is an internal error.  
System response:      Processing continues.  
User action:      Call Xerox Technical Support.

**LDM2111E LDM CALLED TO PERFORM UNSUPPORTED FUNCTION OF** *function code*

Explanation: This is an internal error.  
 System response: Processing continues.  
 User action: Call Xerox Technical Support.

**LDM2112E AVAILABLE BLOCK COUNT OF X'block count' IN library ddname/native library INSUFFICIENT TO SATISFY REQUEST FOR X'blocks requested' BLOCKS**

Explanation: While writing a list to a native library, there were not enough blocks available to meet requirements.  
 System response: Processing continues.  
 User action: Increase the library block count or delete members to release space.

**LDM2113E BPAM ERROR** *reading/writing library list name* **IN LIBRARY** *ddname/native library*, **SYNAD ERROR TEXT=***synad error text*

Explanation: An error occurred while trying to process a PDS.  
 System response: Processing continues.  
 User action: Make sure you request the correct dataset. Proceed as indicated by the SYNAD error message text. The format of the SYNAD message is defined in the IBM manual, *z/OS Data Administration: Macro Instruction Reference*. This error can be caused by I/O errors on a PDS. If this is the case, recover the dataset. If the problem persists, call Xerox Technical Support.

**LDM2114E VSAM ERROR** *reading/writing library list name* **IN library** *ddname/native library*. **RC=X'return code'; REASON CODE=X'reason code'**

Explanation: This is an internal error.  
 System response: Processing continues.  
 User action: If it is not a true I/O error, take the action indicated by the VSAM return and error codes. Refer to the VSAM documentation for more information on the VSAM return and error codes.

**LDM2115E NEITHER DDNAME NOR DSNAME SPECIFIED FOR LIBRARY ALLOCATION**

Explanation: This is an internal error.  
 System response: The library is not allocated.  
 User action: Call Xerox Technical Support.

**LDM2116E    UNABLE TO ALLOCATE DSNAME *native library* FOR INITIALIZATION, DYNAMIC ALLOCATION RC=X'return code'**

Explanation:    An error occurred while allocating a dataset for formatting as a native library.

System response:    Initialization is terminated.

User action:    Verify that the correct library is being initialized. Check the return code in the appropriate z/OS publication on system macros and facilities.

**LDM2117I    INITIALIZATION OF *native library* COMPLETE. *block count* BLOCKS**

Explanation:    The dataset was successfully formatted for use by LDM.

System response:    Processing continues.

User action:    None required.

**LDM2118I    LIBRARY BLOCK COUNT ERROR FOR *library list name* IN *native library*. EXPECTED X'block count', FOUND X'block count'**

Explanation:    While verifying the space map for the named library, the directory entry reported a different number of blocks from the number found by counting the blocks.

System response:    Processing continues.

User action:    The member may be corrupted. Use the LDM batch utility to verify that the member is correct, or delete the member and recreate it.

**LDM2119I    SPACE MAP OF *native library* VERIFIED**

Explanation:    All the members in a native library were checked.

System response:    Processing continues.

User action:    None required.

**LDM211CE    DSNAME '*native library*' IS NOT STRUCTURED ACCORDING TO z/OS DATASET NAMING CONVENTIONS**

Explanation:    This is an internal error.

System response:    The named dataset is not allocated.

User action:    Verify the named dataset is correct. Call Xerox Technical Support.

**LDM211FE    DDNAME HAS NOT BEEN SPECIFIED EITHER IN PRINTER PROFILE OR XINPARM**

Explanation:    A valid DD name must be assigned in the initialization parameters or the printer profiles.

System response:    Processing is terminated.

User action:    Correct either the printer profiles or the XINPARM dataset. If the problem persists, call Xerox Technical Support.

**LDM2120E** *product component* **DOES NOT SUPPORT UNDEFINED RECORDS. RC X'laerrcd'**

Explanation: The named product and component do not support datasets defined with RECFM=U (undefined) at this time.

System response: XOAF is terminated.

User action: Specify a dataset that has not been defined with RECFM=U. Try the request again.

**LDM2121E** **UNABLE TO STOW BLOCK** *library block number* **FOR** *library ddname/native library.*  
**NATIVE LIBRARY IS FULL. RC=X'return code'; IC=X'information code'**

Explanation: A request to stow a library was attempted after a previous request failed.

System response: In XOSF, processing is terminated. The document is incomplete. In XOAF, the entry is removed.

User action: Enlarge the named native library and retry the request.

**LDM2122W** *function* **FAILED BECAUSE A REQUIRED SYSTEM OR PDL STATEMENT IS MISSING OR INVALID**

Explanation: One of these conditions exists:

- A required label is missing or invalid in the PDL.
- The system statement is missing or invalid in the PDL.

System response: Processing continues, but PDL loading is terminated.

User action: Correct the PDL, and retry. Check any accompanying messages for related errors.

**LDM2134E** **PREMATURE END OF FILE READING** *library list name* **IN LIBRARY** *ddname/native library*

Explanation: The forward chain pointer of a list in a native library indicated no more data, but the record pointers indicated there was data still to be read.

System response: Processing continues.

User action: The list is probably corrupted. Delete the list and rebuild it.

**LDM2135E** **UNABLE TO OPEN OFFLOAD OUTPUT DSNAME SYSUT2**

Explanation: LDM attempted to make a logical backup of a native library, but the OPEN of the output dataset (DDNAME SYSUT2) failed.

System response: Processing is terminated.

User action: This is probably a JCL error. Make sure SYSUT2 is present in the JCL.

**LDM2136I**     **MEMBER** *member name* **OFFLOADED SUCCESSFULLY FROM** *native library*. *number of records* **RECORDS**

Explanation:     The specified member was offloaded successfully from the named library and contains the number of records specified.

System response:     Processing continues.

User action:     None required.

**LDM2137I**     **LIBRARY** *native library* **OFFLOADED SUCCESSFULLY.** *number of members* **MEMBERS**

Explanation:     The specified library was offloaded successfully.

System response:     Processing continues.

User action:     None required.

**LDM2138E**     **RECORD SIZE INVALID FOR** *library*

Explanation:     While initializing a VSAM dataset, LDMLINIT found that the record size specified in the DEFINE for the cluster was not equal to the control interval size minus 7.

System response:     Processing is terminated.

User action:     Correct the record size, and resubmit the job.

**LDM2139E**     **CONTROL INTERVAL SIZE INVALID FOR** *native library*

Explanation:     While initializing a VSAM dataset for use, the CISZ was found to be invalid. VSAM restrictions require the CISZ to be 512 bytes, 1KB, 2KB, or 4KB.

System response:     Processing is terminated.

User action:     Correct the VSAM CISZ in the DEFINE step for the named library, and resubmit the job.

**LDM213AE**     **AVAILABLE BLOCK COUNT FOR** *native library* **DOES NOT MATCH SPACE MAP**

Explanation:     While allocating library blocks, the available block count indicated that space was available, but the bitmap indicated no available space.

System response:     Processing is terminated.

User action:     Offload the named library, reinitialize it, and then reload it using the LDMUTIL batch utility.

**LDM213BI**     *native library* **ALREADY FORMATTED FOR USE**

Explanation:     While attempting to format a dataset for use by LDM, a SHOWCB request indicated that the dataset was not empty.

System response:     The format is terminated.

User action:     Use IDCAMS to delete and redefine the dataset if the format is required.

**LDM213CE UNABLE TO OPEN RELOAD INPUT DSNAME SYSUT1**

Explanation: During a reload, the dataset created by the offload function was read using a DD name of SYSUT1. This DD name was not in the JCL.

System response: Processing is terminated.

User action: Correct the JCL and rerun the job.

**LDM213DI LIBRARY *native library* RELOADED SUCCESSFULLY. *number of members* MEMBERS**

Explanation: The reload of the dataset completed successfully.

System response: Processing continues.

User action: None required.

**LDM213EI MEMBER *library member name* RELOADED SUCCESSFULLY TO *native library*. *number of records* RECORDS**

Explanation: The native library member was restored successfully.

System response: Processing continues.

User action: None required.

**LDM213FI UNABLE TO RESERVE *library member name/native library*. LIST IN USE ELSEWHERE**

Explanation: A component requested an enqueue of a list name, but another task was already using the resource.

System response: Processing is terminated.

User action: Try the function again. If the problem persists, determine which task has the resource in queue and attempt to resolve the conflict.

**LDM2140E OPEN FOR *library list name* IN LIBRARY *ddname/native library* REFUSED DUE TO PREVIOUS MEMBER NOT CLOSED**

Explanation: This is an internal error.

System response: Processing continues, but the OPEN request is terminated.

User action: Call Xerox Technical Support.

**LDM2141E BLDL FAILED FOR DDNAME *library ddname*. RC=X'*bldl-r15*'; REASON CODE=X'*bldl-r0*'**

Explanation: XPAF failed while issuing a BLDL macro for the specified ddname library.

System response: Processing is terminated.

User action: If this message is preceded by messages XE13307E and XE13308I, the failure is for the specified ddname library, and the reason code is the hexadecimal number of entries in the library chain. You must reduce the number of entries in the chain before you restart XPAF.

For BLDL return code and reason code meanings, refer to the *z/OS Data Administration: Macro Instructions Reference*. If this is not an environmental error, call Xerox Technical Support.

**LDM2142I NATIVE LIBRARY IS EMPTY**

Explanation: The native library accessed contains no members.  
 System response: Processing continues.  
 User action: None required.

**LDM2143I LIBRARY ALLOCATION LARGER THAN MAXIMUM SUPPORTED SIZE**

Explanation: A native library was allocated that is larger than the maximum size XPAF supports.  
 System response: The maximum amount of space XPAF can use is initialized. The rest is unused.  
 User action: Issue an IDCAMS LISTCAT for the library. If the difference between the High Used RBA and the High Allocated RBA is significant, delete the library, reallocate it using the maximum size supported by XPAF, and initialize the library again.

**LDM2144E VSAM BLOCK FOR MEMBER *member name* IN *filename* HAS ZERO RECORDS.**

Explanation: While reading the named member a VSAM block containing no data was read.  
 System response: Processing is terminated.  
 User action: The named member is probably corrupted. Delete and then recreate the member.

**LDM3010F COULD NOT GET X'*bytes of storage*' BYTES OF MEMORY *activity***

Explanation: This is an internal error.  
 System response: Processing continues.  
 User action: Specify a larger region size. If using XOSF, restart the FSS. If using XOAF, reattempt the task which caused the failure.

**LDM3011E COULD NOT RELEASE X'*amount of storage*' BYTES OF MEMORY FROM LOCATION X'*getmained area address*' *activity***

Explanation: This is an internal error.  
 System response: XPAF processing continues.  
 User action: None required. If the problem persists, call Xerox Technical Support.

**LDM3015E      COULD NOT *activity* LIBRARY *library dsname*. LDM RC=X'return code'**

Explanation:      XPAF could not perform the named activity on the specified library.  
 System response:    LDMUTIL processing is terminated.  
 User action:        Ensure the library exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**LDM3016E      COULD NOT *activity* MEMBER *member name* OF LIBRARY *native library operation*. LDM RC=X'return code'**

Explanation:      XPAF could not perform the named activity on the specified member.  
 System response:    LDM offload processing is terminated.  
 User action:        Ensure the member exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**LDM3017E      COULD NOT *command* LCA *native library operation*. LDM RC=X'return code'**

Explanation:      This is an internal error.  
 System response:    LDM offload processing is terminated.  
 User action:        Increase the region size and make sure the dataset is correct and online. Try the request again.

**LDM3040F      A FATAL READ ERROR OCCURRED WHILE READING DATASET: DDNAME/DSNAME.**

Explanation:      An LDM request to build a directory list has returned a negative member count.  
 System response:    The DDNAME and Data Set name of the corrupted library will be displayed. A return code will be passed back to the calling program and that program may issue additional messages and will determine further actions to be taken.  
 User action:        If the problem persists, you may need to re-DEFINE and INITIALIZE the failing library. If the problem still persists, call Xerox Technical Support.

**LDM3041F      NON-POSITIVE DIRECTORY BLOCK COUNT FOUND IN DATASET: *library ddname/native library***

Explanation:      LDM encountered an invalid directory block count when processing the named library.  
 System response:    The requested LDM function fails and an error return code is passed back to the calling module.  
 User action:        The VSAM library listed in the message is corrupt. Restore the library from a previous good backup, or re-initialize the library.

**LDM3415E ALLOCATION FOR DSNAME=*native library* FAILED. RC=X'return code'; REASON CODE=X'reason code'**

Explanation: LDM was requested to connect to a dataset by dataset name. z/OS dynamic allocation failed.

System response: The library connection is not made. Processing continues.

User action: A return code of 12 indicates an internal error; call Xerox Technical Support. For any other return and reason codes, take action as described in the z/OS publication on dynamic allocation system macros and facilities.

**LDM4004F LDMMAIN DETECTED AN INVALID *control block name* CONTROL BLOCK AT LOCATION X'address'**

Explanation: This is an internal error.

System response: LDMMAIN processing is terminated for this function. XOAF processing continues.

User action: Check accompanying messages for more information about the failure. Ensure that the dataset is available and is not damaged, then rerun the request. If this fails, call Xerox Technical Support.

**LDM4013E XEI INITIALIZATION FAILED**

Explanation: This is an internal error.

System response: Processing is terminated.

User action: Call Xerox Technical Support.

**LDM4014E MSF INITIALIZATION FAILED**

Explanation: This is an internal error.

System response: Processing is terminated.

User action: Call Xerox Technical Support.

**LDM4015E LDM INITIALIZATION FAILED**

Explanation: This is an internal error.

System response: Processing is terminated.

User action: Call Xerox Technical Support.

**LDM4016E OPEN PRINT DCB FAILED**

Explanation: An error occurred while opening the print dataset.

System response: Processing is terminated.

User action: Specify the correct print DCB and try again.

**LDM4017E LDMUTIL INVALID COMMAND**

Explanation: The LDMUTIL program does not recognize the specified command.  
System response: Processing is terminated.  
User action: Specify the correct command and try again.

**LDM4018E REQUESTED FUNCTION FAILED**

Explanation: This is an internal error.  
System response: Processing is terminated.  
User action: Call Xerox Technical Support.

**LDM4019F DIRECTORY OF *library ddname/native library* IS CORRUPTED. CURRENT BLOCK:  
RBA=X'*rba address*'**

Explanation: LDM has detected an invalid directory structure.  
System response: Processing continues.  
User action: Correct the corrupted file. Corrupted files may need to be recreated or restored from backup source. If the problem persists, call Xerox Technical Support.

## MSF messages

---

**MSF0217E**    *module name* **FAILED. UNABLE TO ALLOCATE** *library ddname/native library. RC=X'return code'*

Explanation:    The attempt to allocate the named dataset failed.  
 System response:    Processing continues. Message suppression is ignored.  
 User action:    Make sure the named dataset is cataloged and available to XPAF. Try the request again. If the problem persists, call Xerox Technical Support.

**MSF3360E**    **LOGGING IS SET ON, BUT NO XLOG DATASET WAS SPECIFIED IN XINPARM FOR XLOGDSN. LOGGING DISABLED**

Explanation:    XLOG=Y was specified in the initialization parameter library, but there was no value specified for the XLOGDSN initialization parameter. When XLOG=Y is specified, there must be a corresponding XLOGDSN entry with a log dataset name specified.  
 System response:    Processing continues, but logging is disabled.  
 User action:    Specify a log dataset name for the XLOGDSN initialization parameter and retry the request.

**MSF8001E**    **INVALID FUNCTION REQUEST PASSED TO MSFMAIN BY MODULE** *module name*. **FUNC=C'ccc', OR X'xxxxxx'**

Explanation:    This is an internal error.  
 System response:    The request is ignored. XPAF processing continues.  
 User action:    Call Xerox Technical Support.

**MSF8002W**    **MODULE** *module name* **REQUESTED NON-EXISTENT MESSAGE** *message number*

Explanation:    This is an internal error.  
 System response:    The request is ignored. XPAF processing continues.  
 User action:    Call Xerox Technical Support.

**MSF8003W**    **MODULE** *module name* **REQUESTED MESSAGE** *message number* **WHICH IS LESS THAN ONE BYTE LONG**

Explanation:    This is an internal error.  
 System response:    The requested message is not logged. XPAF processing continues.  
 User action:    Call Xerox Technical Support.

**MSF8004E USER AREA LENGTH IN MCBLOCK IS LESS THAN ONE BYTE. REQUESTING MODULE=*module name*, MSG ID=*message id***

Explanation: This is an internal error.

System response: The message is constructed and logged by MSF as requested, but is not returned in the user area to the requesting module. XPAF processing continues.

User action: Call Xerox Technical Support.

**MSF8005E INVALID SUPPRESS/ENABLE VALUE REQUEST PASSED TO MSF BY MODULE *module name*. VALUE=C'*c*', OR X'*xx*'**

Explanation: This is an internal error.

System response: The request is invalid and is ignored by MSF. XPAF processing continues.

User action: Call Xerox Technical Support.

**MSF8006W CONSOLE SUPPRESSION REQUESTED FOR NON-EXISTENT MESSAGE *message id***

Explanation: This message may be returned as part of the response to an operator request to suppress console messages. It indicates that the displayed message was part of the request but was not in the message table.

System response: The operator request processing continues for valid message numbers and message types. XPAF processing continues.

User action: Verify the message number and whether that message can be suppressed. If the problem persists, call Xerox Technical Support.

**MSF8007W CONSOLE ENABLEMENT REQUESTED FOR NON-EXISTENT MESSAGE *message id***

Explanation: This message may be returned as part of the response to an operator request to enable console messages. It indicates that the displayed message was part of the request but is not in the message table.

System response: The operator request processing continues for valid message numbers and message types. XPAF processing continues.

User action: Verify the message number and whether that message can be suppressed. Messages that cannot be suppressed cannot be enabled, either. If the problem persists, call Xerox Technical Support.

**MSF8008I MESSAGE SUPPRESSION PROCESSING COMPLETE**

Explanation: MSF completed processing an operator request to suppress console messages.

System response: Valid message numbers/message types displayed in the operator request were marked for console suppression. Messages marked for suppression continue to appear on the console if they are critical to the proper operation of XPAF. XPAF processing continues.

User action: None required.

**MSF8009I MESSAGE ENABLEMENT PROCESSING COMPLETE**

Explanation: MSF completed processing an operator request to enable console messages.

System response: Valid message numbers/message types displayed in the operator request were enabled for console appearance. XPAF processing continues.

User action: None required.

**MSF8010E MODULE *module name* MADE AN SIL REQUEST BUT THE USER AREA CONTAINED AN INVALID STRING. VALUE=X'xxxxxx', OR C'ccc'**

Explanation: This is an internal error.

System response: The processing request is ignored. XPAF processing continues.

User action: Call Xerox Technical Support.

**MSF8011I INTENSIVE LOGGING INDICATOR SET ON**

Explanation: The intensive logging indicator has been set on in response to an operator command.

System response: Messages that are to be logged only when intensive logging is on now appear. XPAF processing continues.

User action: None required.

**MSF8012I INTENSIVE LOGGING INDICATOR SET OFF**

Explanation: The intensive logging indicator has been set off in response to an operator command.

System response: Messages that are to be logged only when intensive logging is on do not appear. XPAF processing continues.

User action: None required.

**MSF8031W THERE IS NO MESSAGE TEXT IN THE PROTOTYPE PASSED TO MSFCON. REQUESTER=*module name*, MSG ID=*message id***

Explanation: This is an internal error.

System response: The requested message is not logged. XPAF processing continues.

User action: Call Xerox Technical Support.

**MSF8032W MODULE *module name* PROVIDED FEWER SUBSTITUTION PARAMETERS THAN MESSAGE *message ID* EXPECTS**

Explanation: This is an internal error.

System response: The requested message is logged without a value inserted in any field for which no substitution value was available. XPAF processing continues.

User action: Call Xerox Technical Support.

**MSF8033W USER AREA PROVIDED TO MSFCON SHORTER THAN THE EXPANDED MESSAGE. REQUESTING MODULE=*module name*, MSG ID=*message id***

Explanation: This is an internal error.

System response: The truncated message is logged or returned to the requester as displayed. XPAF processing continues.

User action: Call Xerox Technical Support.

**MSF8034E MSFCON FOUND AN INVALID CONVERSION FACTOR PASSED BY MODULE *module name* FOR MESSAGE *message id***

Explanation: This is an internal error.

System response: The requested message is neither logged nor returned to the requesting module. XPAF processing continues.

User action: Call Xerox Technical Support.

**MSF8035W MODULE *module name* PROVIDED MORE SUBSTITUTION PARAMETERS THAN MESSAGE *message id* EXPECTS**

Explanation: This is an internal error.

System response: The requested message is logged or returned to the requester as displayed. Extra insertion values are ignored. XPAF processing continues.

User action: Call Xerox Technical Support.

**MSF8036W MODULE *module name* REQUESTED MESSAGE *message id* THAT BECAME LONGER THAN 222 BYTES ON EXPANSION AND WAS TRUNCATED**

Explanation: Messages may not exceed the limit of 222 characters due to the size of the XPAF log record. During expansion of a message prototype with insertion values, the displayed message exceeded the maximum length.

System response: The message is truncated at 222 bytes. The truncated message is logged or returned to the requester as displayed. XPAF processing continues.

User action: This message may occur during normal operation due to the inclusion of variable length data (such as dataset names) in informational messages. If you believe this is a problem, call Xerox Technical Support.

**MSF8037E MSF UNABLE TO CONSTRUCT MESSAGE *message id* FOR MODULE *module name***

Explanation: An internal error prevented the MSF from producing the requested message. The most likely reason for this error is a lack of dynamic storage in XPAF's region. If the region is too small, other parts of XPAF are probably affected, too. This message appears when there is no space left in the region.

System response: This error message is logged and processing continues.

User action: Increase the region size. If the problem persists, call Xerox Technical Support.

- MSF8038W    MSF UNABLE TO SUPPRESS OR ENABLE NON-SUPPRESSIBLE MSG ID='message id'**
- Explanation:    The named message ID was identified as suppressed or enabled, but this message is considered non-suppressible. It may not be selected for suppression.
- System response:    Processing continues. Suppression is ignored for this message.
- User action:    Remove the message number from the suppression member identified by the MSFSUPPMEM initialization parameter in XINPARM.
- 
- MSF8040W    MESSAGE THRESHOLD OF *value* HAS BEEN REACHED. SYSLOG MESSAGES WILL BE LOGGED IN XLOG ONLY**
- Explanation:    The message threshold established by the MSGTHMAX initialization parameter has been reached for the dataset currently being transmitted to the printer.
- System response:    All further messages that are issued while this dataset is being transmitted are written only to the XLOG. Processing continues.
- User action:    Review the XLOG to determine whether the messages issued after this message are important to the successful completion of the job.
- 
- MSF8050F    ERROR DURING ATTEMPT TO LOAD MSFTBLD. RC=X'*return code*'; IC=X'*information code*'**
- Explanation:    This is an internal error.
- System response:    XPAF initialization fails. XPAF processing is terminated.
- User action:    Call Xerox Technical Support.
- 
- MSF8051F    ERROR DURING ATTEMPT TO LOAD MSFMAIN. RC=X'*return code*'; IC=X'*information code*'**
- Explanation:    This is an internal error.
- System response:    XPAF initialization fails. XPAF processing is terminated.
- User action:    Call Xerox Technical Support.
- 
- MSF8052F    ERROR DURING ATTEMPT TO LOAD MSFDAIR. RC=X'*return code*'; IC=X'*information code*'**
- Explanation:    An attempt to load support module MSFDAIR has failed.
- System response:    XOSF or XOAF processing is terminated.
- User action:    Call Xerox Technical Support.

**MSF8053F      ERROR DURING ATTEMPT TO GET STORAGE. RC=X'*return code*'; IC=X'*information code*'**

Explanation:      An attempt to load storage has failed.  
 System response:    XOSF or XOAF processing is terminated.  
 User action:        Increase the region size and try the request again. If it fails, call Xerox Technical Support.

**MSF8062E      DAIRFAIL RETURNED CONDITION CODE=X'*return code*'**

Explanation:      This is an internal error.  
 System response:    Error processing continues. This error prevents certain debugging messages from being produced.  
 User action:        Call Xerox Technical Support.

**MSF8063E      MODULE '*calling module*' PASSED AN INVALID FUNCTION TYPE (X'*function type*') TO MSFDAIR**

Explanation:      This is an internal error.  
 System response:    Error processing continues. This error prevents certain debugging messages from being produced.  
 User action:        Call Xerox Technical Support.

**MSF8064W      SUPPRESSION ATTEMPTED BUT MEMBER=*member name* WAS NOT FOUND IN *library ddname/dataset name*. RC=X'*return code*'**

Explanation:      The named member was specified on the MSFSUPPMEM initialization parameter, but was not found in the dataset pointed to by the XINPARM DD statement in the XOSF start-up proc.  
 System response:    Processing continues. Suppression is ignored.  
 User action:        Ensure that the specified member name is spelled correctly and that it is present in the dataset pointed to by the XINPARM DD statement in the XOSF start-up proc.

**MSF8065W      SUPPRESSION FAILED. MISSING REQUIRED HEADER '*header name*' FROM MEMBER=*member name* IN *library ddname/dataset name***

Explanation:      The named header was not found in the specified member as the first non-comment line starting in column 1.  
 System response:    Processing continues. Messages are not suppressed.  
 User action:        Make sure that the required header is the first non-comment line starting in column 1.

**MSF8066W**    **SUPPRESSION FAILED. INVALID SYNTAX FOUND IN MEMBER=***member name* **FROM**  
*library ddname/dataset name*

Explanation:    The named member has either a comma in the wrong place or the ending  
delimiter ' ) ' is missing.

System response:    Processing continues. Messages are not suppressed.

User action:    Correct the syntax error and try the request again.

**MSF8067W**    **SUPPRESSION FAILED. UNABLE TO ACQUIRE AN LCA FOR** *library ddname/dataset*  
*name. RC=X'return code'*

Explanation:    LDM failed to acquire storage to build an LCA.

System response:    Processing continues. Messages are not suppressed.

User action:    Increase the region size. If this does not fix the problem, call Xerox  
Technical Support.

**MSF9900I**    *ibm message number / ibm message text*

Explanation:    This IBM message was issued by an IBM service used by XPAF.

System response:    Processing is not directly affected. The messages describe a problem that  
may affect the job in progress.

User action:    Look up the IBM message number in the appropriate IBM documentation.  
If you need help resolving the problem, call Xerox Technical Support.

## THM messages

---

**THM2201E**    **INTERNAL ERROR:** *thm command. TABLE=table name, DDNAME/DSNAME=table ddname/table library name*

Explanation:    This is an internal error.  
 System response:    A non-zero return code is issued.  
 User action:    Call Xerox Technical Support.

**THM2202E**    **INVALID COMMAND:** *invalid command. TABLE=table name, DDNAME/DSNAME=table ddname/table library name*

Explanation:    This is an internal error.  
 System response:    A non-zero return code is issued.  
 User action:    Call Xerox Technical Support.

**THM2203E**    **GETMAIN FAILED:** *thm command. TABLE=table command, DDNAME/DSNAME=table ddname/table library name*

Explanation:    This is an internal error.  
 System response:    A non-zero return code is issued.  
 User action:    Increase the region size and try the function again.

**THM2204E**    **TABLE WAS NOT OPENED WITH THIS TCB:** *thm command. TABLE=table name, DDNAME/DSNAME=table ddname/table library name*

Explanation:    This is an internal error.  
 System response:    A non-zero return code is issued.  
 User action:    Call Xerox Technical Support.

**THM2205E**    **INVALID EYECATCHER:** *thm command. TABLE=table name, DDNAME/DSNAME=table ddname/table library name*

Explanation:    This is an internal error.  
 System response:    A non-zero return code is issued.  
 User action:    Call Xerox Technical Support.

**THM2206E**    **LIBRARY IS FULL:** *thm command. TABLE=table name, DDNAME/DSNAME=table ddname/table library name*

Explanation:    This is an internal error.  
 System response:    A non-zero return code is issued.  
 User action:    Call Xerox Technical Support.

**THM2207E**    **TOO FEW OPERANDS:** *thm command. TABLE=table name, DDNAME/DSNAME=table ddname/table library name*

Explanation:    This is an internal error.  
System response:    A non-zero return code is issued.  
User action:    Call Xerox Technical Support.

**THM2208E**    **TDB IS TOO SHORT:** *thm command. TABLE=table name, DDNAME/DSNAME=table ddname/table library name*

Explanation:    This is an internal error.  
System response:    A non-zero return code is issued.  
User action:    Call Xerox Technical Support.

**THM2209E**    **ERROR WHILE EDITING NEW TABLE DEFINITION:** *thm command. TABLE=table name, DDNAME/DSNAME=table ddname/table library name*

Explanation:    This is an internal error.  
System response:    A non-zero return code is issued.  
User action:    Call Xerox Technical Support.

**THM220AE**    **CHANGED TABLE HAS DUPLICATE KEY:** *thm command. TABLE=table name, DDNAME/DSNAME=table ddname/table library name*

Explanation:    This is an internal error.  
System response:    A non-zero return code is issued.  
User action:    Call Xerox Technical Support

**THM220CE**    **THIS TCB CANNOT BE USED FOR:** *thm command. TABLE=table name, DDNAME/DSNAME=table ddname/table library name*

Explanation:    This is an internal error.  
System response:    A non-zero return code is issued.  
User action:    Call Xerox Technical Support.

**THM220DW**    **STOW IS NOT TO SAME LIBRARY.** *TABLE=table name, DDNAME/DSNAME=table ddname/table library name*

Explanation:    The STOW list contains references to tables that do not belong in the same library.  
System response:    XPAF processing continues.  
User action:    None required.

## UFL messages

---

### UFL0303E      **FIRST RECORD OF** *member name* **IS NOT A VALID HEADER RECORD**

Explanation:      The format of the input does not conform to the Xerox header record format. If the input is a sequential dataset, the word INPUT appears in the message text. If the input is a member of a PDS, the member name is given.

System response:      Processing is terminated and the font is not loaded.

User action:      Verify that the input is a valid font. If the problem persists, call Xerox Technical Support.

### UFL0305E      **COULD NOT** *activity* **TABLE** *table name operation*. **THM RC=X'***return code'*

Explanation:      An attempt to process the indicated table failed. *Operation* identifies the type of processing that was being performed when the error occurred.

System response:      Command processing is terminated.

User action:      Call Xerox Technical Support.

### UFL0308I      *number fonts* **PROCESSED**. *number* **WITH ERRORS**

Explanation:      The identified number of fonts have been loaded. Some may have loaded with errors.

System response:      Font loading is terminated. XOAF processing continues.

User action:      If no errors are indicated, no action is required. If errors occurred, review the XOAF log for more information.

### UFL0501E      **COULD NOT** *activity* **FOR MEMBER** *member name* **OF DSNAME** *dataset name*. **EI RC=X'***return code'*

Explanation:      The indicated activity for the named dataset member could not be performed.

System response:      Font loading is terminated.

User action:      If the problem persists, call Xerox Technical Support.

### UFL0503E      *process type* **IS MISSING THE PROPER FONT TYPE OR IS AN INVALID FONT TYPE**

Explanation:      The named process type was not appropriate for the selected load function.

System response:      Font loading is terminated.

User action:      Specify a valid font process type. The font type can be 2700, 270X, 270R, 9700, or REPL. Refer to the *XPAF TSO/Batch Commands Quick Reference Card* for the font types that are valid for each load function. If the problem persists, call Xerox Technical Support.

**UFL0504E MISSING OR INVALID *dataset name* DSNAME**

Explanation: The indicated dataset name was either missing or not formatted properly.  
System response: Font loading is terminated.  
User action: Enter the specified input or output dataset correctly.

**UFL0505E OUTPUT DATASET *dataset name* IS NOT A VSAM LIBRARY**

Explanation: The named output dataset is not a VSAM dataset.  
System response: Font loading is terminated.  
User action: Specify a native library as the target library. If the problem persists, call Xerox Technical Support.

**UFL0506E WORK AREA ADDRESS NOT SPECIFIED**

Explanation: The calling program did not construct the parameter list properly.  
System response: Font loading is terminated.  
User action: If problem persists, call Xerox Technical Support.

**UFL0507W WARNING: FONT ASCII NAME *ascii name* AND FONT RAD50 NAME *rad50 name* DO NOT MATCH. FONT STORED WITH NAME *rad50 name***

Explanation: When it loaded this centralized font to the font library, XOAF determined that the ASCII font name and RAD50 font header name do not match.  
System response: The font is loaded into the font library. The RAD50 name is used to create a XPAFXFI table entry for this font in the font table library.  
User action: None required.

**UFL050AI AFW ENTRY BUILT FOR FONT *font name***

Explanation: An XPAFAFW table entry was successfully created for the named replica font.  
System response: XPAF processing continues.  
User action: None required.

**UFL050BE COULD NOT BUILD AN AFW ENTRY FOR *font name***

Explanation: While loading a replica font to a native library, the font loader was unable to generate an XPAFAFW table entry for the named replica font.  
System response: Processing continues.  
User action: Check the specified input font and ensure that it is a valid replica font.

**UFL050CI      FONT *font name* LOADED SUCCESSFULLY TO *dataset name***

Explanation:      The named font was loaded successfully to the native library specified by *dataset name*.

System response:      XOAF processing continues.

User action:      None required.

**UFL0741W      FONT *font name* LOADED. NO AFW ENTRY BUILT DUE TO ORIENTATION MISMATCH**

Explanation:      The orientation indicated by the last character of the font name does not match the orientation specified using the TSO/batch command or XOAF option to load custom replica fonts. Refer to the *XPAF TSO/Batch Commands Quick Reference Card* for more information on the command. Refer to [Section Three: Managing Resources with XPAF](#) for more information on the XOAF options.

System response:      XOAF processing continues. The custom font is loaded, but no XPAFAFW table entry is created.

User action:      If you want an XPAFAFW table entry to be created, correct the orientation specified on the XOAF panel or TSO/batch command, then try again. If an XPAFAFW table entry is not needed, no action is required.

**UFL1422E      INPUT MEMBER NAME MUST BE PRESENT IF RESOURCE IS PDS OR CONTAINS NO HEADER**

Explanation:      The input dataset is a partitioned dataset. A member name must be specified if the input is partitioned.

System response:      Command processing is terminated.

User action:      Specify the relevant member name or enter an asterisk ( \* ) to load all members.

**UFL1425E      INPUT MEMBER *member name* OF DSNAME '*dataset name*' IS EMPTY**

Explanation:      The member specified as input for the font load does not contain any data.

System response:      Command processing is terminated.

User action:      Specify a member that contains the font to be loaded.

**UFL1426E      INPUT DSNAME '*dataset name*' IS EMPTY**

Explanation:      The sequential dataset specified as input for the font load does not contain any data.

System response:      Command processing is terminated.

User action:      Specify a sequential dataset or a member of a PDS that contains the font to be loaded.

**UFL3015E**      **COULD NOT** *activity* **LIBRARY** *library ddname activity*. **LDM RC=X'***return code'*

Explanation:      XPAF could not perform the named activity on the specified library.  
System response:      Font loading is terminated.  
User action:      Ensure the library exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**UFL3016E**      **COULD NOT** *activity* **MEMBER** *member name* **OF LIBRARY** *library dsname operation*. **LDM RC=X'***return code'*

Explanation:      XPAF could not perform the named activity on the specified member.  
System response:      Font loading is terminated.  
User action:      Ensure the member exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**UFL3017E**      **COULD NOT** *activity* **LCA** *activity*. **LDM RC=X'***return code'*

Explanation:      This is an internal error.  
System response:      Font loading is terminated.  
User action:      Call Xerox Technical Support.

**UFL3018E**      **COULD NOT ACQUIRE TCB** *activity*. **THM RC=X'***return code'*

Explanation:      This is an internal error.  
System response:      Command processing is terminated.  
User action:      Call Xerox Technical Support.

**UFL4211E**      **LOGICAL RECORD LENGTH OF** *input* **DATASET MUST BE 128**

Explanation:      When loading custom Xerox fonts, the LRECL cannot be greater than 128 bytes.  
System response:      The task is terminated.  
User action:      The dataset needs to be redefined with LRECL=128.

**UFL6402E**      **COULD NOT** *command* **ITEM** *item name* **IN TABLE** *table name activity*. **THM RC=X'***return code'*

Explanation:      The requested processing could not be performed on the specified table. This message is issued for diagnostic purposes. *Activity* identifies the type of processing that was being performed when the error occurred.  
System response:      Font loading is terminated.  
User action:      Call Xerox Technical Support.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>UFT0300E</b>  | <i>module name</i> <b>FAILED TO</b> <i>activity</i> . <b>PROGRAM</b> <i>module name status</i>                                                                                                                                                                                                                                                                                                                                              |
| Explanation:     | An error occurred, either during initialization or shut down of the LDM or THM environment.                                                                                                                                                                                                                                                                                                                                                 |
| System response: | Processing continues or is terminated, as indicated in the message.                                                                                                                                                                                                                                                                                                                                                                         |
| User action:     | If the named module failed to initialize, call Xerox Technical Support. If the named module failed to terminate, check for additional messages in the system log. If no other error messages appear in the log, font table library processing was not affected and processing can continue. If there are additional error messages in the log, refer to the explanations for those messages to determine if additional action is necessary. |
| <b>UFT0305E</b>  | <b>COULD NOT</b> <i>thm function</i> <b>TABLE</b> <i>table name operation</i> . <b>THM RC=X'</b> <i>return code'</i>                                                                                                                                                                                                                                                                                                                        |
| Explanation:     | The named THM function failed. <i>Operation</i> identifies the type of processing that was being performed when the error occurred.                                                                                                                                                                                                                                                                                                         |
| System response: | Processing is terminated.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| User action:     | Call Xerox Technical Support.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>UFT0700E</b>  | <b>AN ERROR HAS OCCURRED IN PROCESSING. SEE LOG FOR MORE INFORMATION</b>                                                                                                                                                                                                                                                                                                                                                                    |
| Explanation:     | An error occurred during the creation of IBM-related tables.                                                                                                                                                                                                                                                                                                                                                                                |
| System response: | Depends on the type of error. Refer to the messages in the XLOG for more information.                                                                                                                                                                                                                                                                                                                                                       |
| User action:     | If the problem persists, call Xerox Technical Support.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>UFT0701I</b>  | <i>function</i> <b>COMPLETED</b> <i>successfully/unsuccessfully</i>                                                                                                                                                                                                                                                                                                                                                                         |
| Explanation:     | The indicated function completed as specified.                                                                                                                                                                                                                                                                                                                                                                                              |
| System response: | XPAF processing continues.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| User action:     | Check the system log for errors or for more information. If the problem persists, call Xerox Technical Support.                                                                                                                                                                                                                                                                                                                             |
| <b>UFT0702E</b>  | <b>COULD NOT</b> <i>command</i> <b>FILE</b> <i>file name operation</i> . <b>EI RC=X'</b> <i>return code'</i>                                                                                                                                                                                                                                                                                                                                |
| Explanation:     | The named file did not respond to the indicated command.                                                                                                                                                                                                                                                                                                                                                                                    |
| System response: | Command processing is terminated.                                                                                                                                                                                                                                                                                                                                                                                                           |
| User action:     | Use the return code as a guide to determine the exact nature of the problem.                                                                                                                                                                                                                                                                                                                                                                |

**UFT0705E SPECIFIED FONT INFORMATION TABLE *name* DOES NOT EXIST**

Explanation: The font specified by UFTMAIN to create font translation tables does not exist in the XPAFXFI table.

System response: The request cannot be processed.

User action: Specify the correct font name or create a XPAFXFI table entry. If the problem persists, call Xerox Technical Support.

**UFT0706E UNKNOWN KEYWORD *keyword* ENCOUNTERED IN LIST *list name* IN DSNAME *dataset name***

Explanation: The indicated keyword was found while creating a character mapping table using the data provided in the named dataset and list.

System response: Character mapping table creation is terminated.

User action: Correct the contents of the dataset and try again. If the problem persists, call Xerox Technical Support.

**UFT0708E CHARACTER ID *charid* ALREADY EXISTS IN TABLE *character mapping table name*. REQUEST IGNORED**

Explanation: The CREATE function could not be used to replace an existing entry in the named character mapping table.

System response: The replace is ignored and no change is made.

User action: If the change is required, you must rebuild the character mapping table. If this condition results from a keying error, correct it and try again. If the problem persists, call Xerox Technical Support.

**UFT0709E UNABLE TO CONVERT CHARACTER *character* TO BINARY FORMAT**

Explanation: To store font widths and heights in the XPAFXFI table, the values must be converted from character to binary format. The conversion terminated when a non-numeric value was entered.

System response: XPAFXFI table processing is terminated.

User action: Enter only numeric values for font width and height. If the problem persists, call Xerox Technical Support.

**UFT070AI PROCESSING COMPLETE. SEE LOG FOR MESSAGES**

Explanation: Processing is complete, but errors occurred during processing.

System response: XPAF processing continues.

User action: Examine the messages in the log to determine which errors have occurred. To learn the appropriate user action, refer to the documentation for each message.

**UFT070BE**     *function* **UNSUCCESSFUL. charid DOES NOT EXIST IN THE IPSTND TABLE**

- Explanation: An attempt was made to create, update, or delete a character mapping entry in the IPSTND table. However, the named *charid* does not exist and therefore could not be created, updated, or deleted.
- System response: The character mapping entry is not created, updated, or deleted.
- User action: Verify that the *charid* matches the one you are trying to create, update, or delete.

**UFT070CE**     **COULD NOT** *function charid* **AS IT IS A DEFAULT ENTRY**

- Explanation: The named charid is an XPAF default entry and cannot be modified or deleted. You cannot modify any of the XPAF-supplied entries. Modifying this entry would affect all AFP documents printed through XPAF.
- System response: The named function is terminated.
- User action: If you are adding a new font to XPAF, you must convert the font to the Xerox ISO8859-1 mapping convention. For instructions, refer to [Section Three: Managing Resources with XPAF](#). If the ISO8859-1 convention is used, you do not need to modify any default IPSTND entries.

**UFT070DE**     *function* **ABORTED. COULD NOT FIND IPDFLT TABLE**

- Explanation: While attempting to create, update, or delete an IPSTND entry, the IPDFLT table was not found in the library in which the font tables are stored.
- System response: Processing is terminated.
- User action: The IPDFLT table must be present before the IPSTND table can be modified.

**UFT070EE**     *function* **UNSUCCESSFUL. character set name DOES NOT EXIST IN I2X TABLE**

- Explanation: The character set you were creating, updating, or deleting does not exist in the XPAFI2X table.
- System response: Processing is terminated.
- User action: Verify that you entered the correct character set name and try the function again. If the problem persists, call Xerox Technical Support.

**UFT070FE**     *function* **UNSUCCESSFUL. PLANE plane IS RESERVED FOR XEROX USE**

- Explanation: The plane you selected for the character identifier you are adding to the IPSTND table is reserved for Xerox use.
- System response: The IPSTND entry is not created.
- User action: Change the plane number to one that is available for customer modification. Currently, planes 00 through 0B are reserved for Xerox use; planes 0C through 0F are available for customer use. Note that it is the last character of the 'PLANE' number entry that references the plane.

|                 |                                                                                                                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 | Explanation: The font table library merge process ended without error. This message lists the number of tables merged into the base library.                                                                               |
|                 | System response: Processing continues.                                                                                                                                                                                     |
|                 | User action: None required.                                                                                                                                                                                                |
| <b>UFT0713I</b> | <b>ITEM</b> <i>item name</i> <b>FROM TABLE</b> <i>table name</i> , <b>FILE DDNAME DELTLIB WAS</b> <i>thm process description</i> <b>INTO TABLE</b> <i>table name</i> , <b>FILE DDNAME BASELIB</b>                          |
|                 | Explanation: This message is written to the UFTPRINT file when an individual table item from the delta library is either inserted or replaced into the base font library table during font table merge processing.         |
|                 | System response: Processing continues.                                                                                                                                                                                     |
|                 | User action: None required.                                                                                                                                                                                                |
| <b>UFT0714I</b> | <i>item count</i> <b>ITEMS INSERTED.</b> <i>item count</i> <b>ITEMS REPLACED INTO FILE DDNAME BASELIB</b>                                                                                                                  |
|                 | Explanation: This message identifies the number of items inserted and the number of items replaced in the base font table library. It is displayed when the font table library merge process is complete.                  |
|                 | System response: Processing continues.                                                                                                                                                                                     |
|                 | User action: None required.                                                                                                                                                                                                |
| <b>UFT0715I</b> | <b>DELTA FILE CREATE COMPLETED SUCCESSFULLY.</b> <i>table count</i> <b>DELTA TABLES CREATED, IN FILE DDNAME DELTLIB</b>                                                                                                    |
|                 | Explanation: The font table library delta create process ended without error. This message identifies the number of tables created.                                                                                        |
|                 | System response: Processing continues.                                                                                                                                                                                     |
|                 | User action: None required.                                                                                                                                                                                                |
| <b>UFT0723W</b> | <b>MEMBER</b> <i>member name</i> <b>DOES NOT CONTAIN A VALID</b> <i>item name</i> . <b>MEMBER NOT PROCESSED</b>                                                                                                            |
|                 | Explanation: The named item (such as a code page control structured field or code page index) was not found in the named member. The member probably contains a corrupted character set or code page.                      |
|                 | System response: The named member is bypassed and processing continues with the next member.                                                                                                                               |
|                 | User action: Make sure the named member is free of corrupted data. Trying to print AFP documents that refer to corrupted resources can result in documents that cannot be printed (due to IBM-to-Xerox conversion errors). |

**UFT0724E LDM ENCOUNTERED AN ERROR TRYING TO** *action*

Explanation: LDM encountered an error while processing fonts.  
 System response: IBM font utility (UFTIFL) processing and table creation are both terminated.  
 User action: See the LDM message in the log to determine how to respond to the error.

**UFT0730W THE FOLLOWING CHARIDS ARE NOT SUPPORTED IN THE IPSTND TABLE:**

Explanation: When converting an IBM font library, some charids were found that did not have a corresponding entry in the IPSTND table. This message is always accompanied by message UFT0731W that lists the unsupported charids.  
 System response: Processing is terminated for this font. The font cannot be used with XPAF.  
 User action: If the named character is required, you must add it to XPAF using the XPAF Update the IPSTND Table on the Install Custom Replica Fonts (Version 5 encoding or below) menu. For information about using custom fonts, refer to [Section Three: Managing Resources with XPAF](#).

**UFT0731W** *charid charid charid charid charid charid charid*

Explanation: This message lists the character IDs associated with message UFT0730W.  
 System response: Refer to message UFT0730W.  
 User action: Refer to message UFT0730W.

**UFT0732W THE FOLLOWING CHARACTER SETS DO NOT HAVE A VALID I2X TABLE ENTRY:**

Explanation: While creating the font tables that contain IBM font characteristics, XPAF found some character sets that did not have a corresponding entry in the XPAFI2X table. This message is always accompanied by message UFT0733W, which lists the affected character sets.  
 The XPAFI2X table, which is supplied with XPAF, identifies the replica fonts that make up a supported IBM character set. These messages indicate that you are using an IBM font for which there is no XPAF-supplied replica font.  
 System response: Processing completed. For all character sets that were missing XPAFI2X table entries, no XPAFEFW table entry was created.  
 User action: If the named character set is required, call Xerox Font Services to obtain the necessary custom fonts for these character sets. For information about using custom fonts, refer to [Section Three: Managing Resources with XPAF](#).

**UFT0733W** *charset charset charset charset charset charset charset charset charset*

Explanation: This message lists the character sets associated with message UFT0732W.  
 System response: Refer to message UFT0732W.  
 User action: Refer to message UFT0732W.

**UFT0734W THE FOLLOWING REPLICA FONTS DO NOT HAVE A VALID AFW TABLE ENTRY:**

- Explanation: The fonts listed in message UFT0735W were referenced in an XPAFI2X table entry, but a corresponding XPAFAFW table entry for the font was not found.
- System response: The XPAFEFW table entries for the listed character sets are not built.
- User action: Make sure the XPAFI2X table entry specifies the correct font name. If the XPAFI2X table entry is correct, then ensure that the replica font has been loaded into the native font library with the TYPE(REPL) parameter specified.

**UFT0735W** *font font font font font*

- Explanation: This message lists the fonts associated with message UFT0734W.
- System response: Refer to message UFT0734W.
- User action: Refer to message UFT0734W.

**UFT0736E** *function* **UNSUCCESSFUL. THE HIGHEST PLANE AVAILABLE IS 0F**

- Explanation: You attempted to update or create a table entry in a plane greater than 0F.
- System response: The table entry remains unchanged. Processing continues.
- User action: Create or update an entry in plane 0C, 0D, 0E, or 0F. Anything less than 0C is protected, and anything greater than 0F does not exist.

**UFT0737W NOT ALL CHARIDS IN CHARACTER SET charset COULD BE FOUND IN CODE PAGE codepage. SEE LOG FOR DETAILS.**

- Explanation: While generating an XPAFIFW or XPAFIFW3 table entry for the indicated character set and code page, message UFT073DW was issued to the XOAF or XOSF LOG.
- System response: Processing continues.
- User action: Refer to the corresponding XOAFLOG or XOSFLOG and refer to the UFT073DW messages to determine which CHARIDS could not be found.

**UFT073AW UNABLE TO BUILD AN IFW TABLE ITEM FOR MEMBER** *member name*

- Explanation: A call to UFTIFLIW to build an XPAFIFW table entry returned a non-zero return code.
- System response: IBM font utility processing and table creation are both terminated.
- User action: See the system log message to determine how to respond to the error. If the problem persists, call Xerox Technical Support.

**UFT073CE UNABLE TO FIND REPLICA FONT FOR PLANE *plane id* IN CHAR SET *character set name* IN IBM-TO-XEROX TABLE**

- Explanation: XOAF could not find a replica font for the named plane ID in the identified character set in the XPAFI2X table.
- System response: The XPAFEFW table entry is not built. Processing continues.
- User action: Take these steps:
- Using the custom font documentation you received from your font vendor, verify that you specified the correct split and plane numbers in the IPSTND and/or XPAFI2X tables.
  - Verify that all point sizes in the XPAFI2X table have a “P” prefix.
- After correcting any problems, rerun RJOB105. If the problem persists, contact your font vendor to confirm that you received the correct character mapping values.

**UFT073DW UNABLE TO MATCH FNI CHARID *charid* FROM CSN *character set name* TO CPI RECORD IN *code page name* CODE PAGE**

- Explanation: The *charid* in the FNI record of the *character set name* member was not found in the CPI record of the *code page name* member.
- System response: No XPAFIFW table entry is created.
- Verify that RJOB105 (update IBM font characteristics information) has been run during the installation process for the font libraries named by your print jobs. For more information, refer to [Section Two: Installing and Customizing XPAF](#). If the problem persists, call Xerox Technical Support.

**UFT073EW IBM CHARACTER ID *charid* IS NOT PRESENTLY SUPPORTED**

- Explanation: The named *charid* found in an IBM code page member does not have a matching character in Xerox’ replica fonts.
- System response: The affected XPAFE2A table is built, but a default ASCII value is used to represent the missing character ID.
- User action: If the problem persists, call Xerox Technical Support.

**UFT073FW *character set name* CHARACTER SET NAME NOT FOUND IN I2X TABLE. NOT PRESENTLY SUPPORTED**

- Explanation: While creating XPAFEFW table items, an IBM character set name was found that was not represented in the XPAFI2X table. Xerox does not have fonts to duplicate the appearance of the named character set.
- System response: No XPAFEFW table item is built for this character set name. Processing continues.
- User action: If the named character set is required, call Xerox Technical Support.

|                  |                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>UFT0740I</b>  | <b>ENTRY ADDED TO I2X FOR</b> <i>character set id</i> <b>BASED ON EXISTING ENTRY FOR</b> <i>model character set id</i>                                                                                                                                                                                                                                                            |
| Explanation:     | The named character set was found in the IBM font library that is not supported in the XPAFI2X table. However, the characteristics of the unsupported font (size, typeface name, style, and weight) match those of a supported character set. The XPAFI2X table entry of the supported character set was used as a model to create a new entry for the unsupported character set. |
| System response: | Processing continues.                                                                                                                                                                                                                                                                                                                                                             |
| User action:     | Make sure the new character set is an acceptable substitute for the unsupported IBM character set. The newly created character set will be used whenever the unsupported font is specified in an AFP document. If the newly created font is not an acceptable substitute for the unsupported IBM font, call Xerox Font Services to obtain a custom font.                          |
| <b>UFT1403F</b>  | <b>FATAL ERROR ENCOUNTERED BY</b> <i>module name</i> <b>DURING</b> <i>ldm process name</i> <b>LDM PROCESSING. RC=X'return code'; IC=X'lcaerrcd'. | <b>UFT1423E</b>  | <b>UNABLE TO BUILD DIRECTORY LIST FOR</b> <i>DSNAME dataset name</i> . <b>LDM RC=</b> <i>return code</i>                                                                                                                                                                                                                                                                          |
| Explanation:     | RC is the error code returned by the LCAERRCD field. Additional system log messages may provide more information.                                                                                                                                                                                                                                                                 |
| System response: | Font table processing is terminated.                                                                                                                                                                                                                                                                                                                                              |
| User action:     | Correct the problem identified by LDM and rerun the job. If the problem persists, call Xerox Technical Support.                                                                                                                                                                                                                                                                   |

**UFT3018E      COULD NOT ACQUIRE TCB *operation*. THM RC=X'return code'**

Explanation:      This is an internal error.  
 System response:      Command processing is terminated.  
 User action:      Call Xerox Technical Support.

**UFT4005E      THM ERROR DURING *operation* FOR *table name* ITEM KEY *key*. THM IC=X'information code'; RC=X'return code'**

Explanation:      This is an internal error.  
 System response:      Conversion is terminated.  
 User action:      Call Xerox Technical Support.

**UFT4012E      INVALID PARAMETER LIST PASSED TO *module name***

Explanation:      This is an internal error.  
 System response:      Conversion is terminated.  
 User action:      Call Xerox Technical Support.

**UFT6261E      SEVERE ERROR ENCOUNTERED BY *module name* DURING *option* LDM PROCESSING. RC=X'return code'; IC=X'lcaerrcd'. UNABLE TO OBTAIN LCA FOR FILE DDNAME *file ddname***

Explanation:      RC is the return code from the LDM function. IC is the error code returned by the LCAERRCD field. Additional system log messages may provide more information.  
 System response:      Font table processing is terminated.  
 User action:      Correct the problem identified by LDM and rerun the job. Other messages should precede this message and provide more information. If the problem persists, call Xerox Technical Support.

**UFT6262E      MINOR ERROR ENCOUNTERED BY *module name* DURING *option* LDM PROCESSING. RC=X'return code'; IC=X'lcaerrcd'. UNABLE TO *action* FILE DDNAME *image library ddname***

Explanation:      RC is the return code from the LDM function. IC is the error code returned by the LCAERRCD field. Additional system log messages may provide more information.  
 System response:      Font table processing is not affected. Processing continues.  
 User action:      Correct the problem identified by LDM. Other messages should precede this message and provide more information. If the problem persists, call Xerox Technical Support.

**UFT6402E** **COULD NOT** *thm command* **ITEM** *item key* **IN TABLE** *table name* **IN LIBRARY DDNAME** *file ddname operation*. **THM RC=X'***return code'*

Explanation: This message is issued for diagnostic purposes. *Operation* identifies the type of processing that was being performed when the error occurred. The THM command can be INSERT, GET, or REPLACE:

- For INSERT, there are two possibilities:
  - If the error occurred while processing the delta file create (module UFTDLTC) and the return code value is 4, then the item being inserted already exists.
  - If the return code value is greater than 4 or if the error occurred while processing the table file merge, this is an internal error.
- For GET or REPLACE, this is an internal error.

System response: Processing is terminated.

User action: There are two alternatives:

- If the THM command was INSERT, rerun the delta file create (module UFTDLTC). Make sure the delta file VSAM cluster has been deleted and redefined. Other messages should precede this message and provide more information. If the problem continues, call Xerox Technical Support.
- If the THM command was GET or REPLACE, call Xerox Technical Support.

**UFT6421E** **ENTRY FOR THE** *character set/code page item name* **COULD NOT BE** *inserted/replaced* **IN THE** *table name* **TABLE**

Explanation: This message is issued when an entry cannot be inserted or replaced in named table, which can be either the CPGID or the FGID table. *Item name* is the name of the character set or code page for which the error occurred.

System response: Font table update processing is terminated.

User action: Examine your font table library to determine if the named table exists or is in error. Verify that the IBM font library is valid. Resubmit the job.

## UIL messages

| System response: | XOAF processing continues.                                                                                                                                                                      |
| User action:     | Check the system log for errors or for more information if it finished unsuccessfully. If the problem persists, call Xerox Technical Support.                                                   |
| <b>UIL1104E</b>  | <i>loader name</i> <b>ERROR: NO INPUT RECORDS FOUND IN INPUT MEMBER</b>                                                                                                                         |
| Explanation:     | The color conversion table loader found no records to process.                                                                                                                                  |
| System response: | Color conversion table loader processing is terminated.                                                                                                                                         |
| User action:     | Verify that the input member has records, and reload the color conversion table.                                                                                                                |
| <b>UIL1107E</b>  | <b>INPUT FILE</b> ( <i>dataset name</i> ) <b>MUST BE A PARTITIONED DATASET</b>                                                                                                                  |
| Explanation:     | The dataset specified as input to the color conversion table loader is not a partitioned dataset. You must specify a PDS member as input to the color conversion table loader.                  |
| System response: | Color conversion table loader processing is terminated.                                                                                                                                         |
| User action:     | Check the input dataset name and ensure a PDS is specified.                                                                                                                                     |

**UIL1109E      VALIDATION ERRORS HAVE OCCURRED. SEE UJLLIST FOR DETAILS**

Explanation:    The color conversion table loader encountered one or more validation errors in the ISL source.

System response:    The color conversion table loader continues validating the remaining ISL.

User action:    To locate the errors, examine the UJLLIST output. Correct the errors, and reload the color conversion table.

**UIL3018E      COULD NOT ACQUIRE TCB *activity*. THM RC=X'*return code*'**

Explanation:    This is an internal error.

System response:    Processing is terminated.

User action:    Call Xerox Technical Support.

**UIL7501E      *ldm command* ERROR. EC=X'*error code*'**

Explanation:    An error occurred while attempting to access a PDS or native library. EC is the error code returned from the LDM.

System response:    Color conversion table loader processing is terminated.

User action:    Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**UIL9099E      UNABLE TO ALLOCATE STORAGE FOR *activity***

Explanation:    Storage was needed for the named activity, but could not be obtained.

System response:    Color conversion table loader processing is terminated.

User action:    Verify that the region size is large enough to acquire work areas, and resubmit the job.

## UIX messages

---

### UIX0220E     **DATASET** *dataset name* **NOT FOUND**

Explanation:     The named dataset does not appear in the system catalog.  
 System response:     XOAF processing is terminated.  
 User action:     Make sure the dataset name was entered correctly, then retry the option.

### UIX0701I     *function* **COMPLETED** *status*

Explanation:     The indicated function completed either successfully or unsuccessfully.  
 System response:     XOAF processing continues.  
 User action:     Check the system log for errors or for more information. If the problem persists, call Xerox Technical Support.

### UIX0711I     **NO UPDATES REQUESTED FOR TABLE**

Explanation:     While updating a color cross-reference table, you did not enter any values in the 'Set' and 'To' fields.  
 System response:     The color cross-reference table is not updated. XOAF returns to the Maintain Color Cross-Reference Tables panel.  
 User action:     None required. If you wish to update the color cross-reference table, enter the appropriate values in the 'Set' and 'To' fields before you press ENTER.

### UIX3018E     **COULD NOT ACQUIRE TCB** *operation*. **THM RC=X**'*return code*'

Explanation:     This is an internal error.  
 System response:     Command processing is terminated.  
 User action:     Call Xerox Technical Support.

### UIX4005E     **THM ERROR DURING** *operation* **FOR** *table name*, **ITEM KEY** *key*. **THM IC=X**'*information code*'; **RC=X**'*return code*'

Explanation:     An error occurred in table processing.  
 System response:     Processing is terminated.  
 User action:     Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**UIX4009E      TABLE *table name* DOES NOT EXIST**

Explanation:    The specified table name was not found in the dataset.  
System response:    Processing is terminated.  
User action:    Enter a unique table name and try the request again.

**UIX4010E      TABLE *table name* ALREADY EXISTS**

Explanation:    A request to create a new table was entered, but the specified table name was found in the dataset.  
System response:    Processing is terminated.  
User action:    Enter a unique table name and try the request again.

## UJL messages

---

### UJL0001I *message text*

- Explanation: *Message text* consists of a message produced by another component. Refer to the chapter of the specified component for an explanation of this message.
- System response: Refer to the documentation for the specified component.
- User action: Refer to the documentation for the specified component.

### UJL0002I **ERROR OPENING** *dataset name. RC=X'return code'*

- Explanation: An error occurred while attempting to access a PDS or native library.
- System response: PDL loader processing is terminated.
- User action: Other messages accompany this message and provide more information. If the problem persists, call Xerox Technical Support.

### UJL0003I *message text*

- Explanation: This message is produced with all attempts to use the PDL loader to load a file type other than a PDL object file.
- System response: File is ignored.
- User action: Verify that you are specifying PDL object files when using PDL object management.

### UJL0202E **THM UNABLE TO ACQUIRE TCB FOR MODULE** *module name. RC=X'return code'*

- Explanation: The THM GETTCB request failed for the named module.
- System response: XOAF processing is terminated.
- User action: This error may be due to insufficient storage. Increase the region size and retry the option. If the option fails again for the same reason, call Xerox Technical Support.

### UJL0203E **THM ERROR IN MODULE** *module name. CMD=thm command; IC=X'thm-information code'; RC=X'thm-return code'*

- Explanation: While attempting to process an XPAF VSAM dataset, an unexpected error was encountered. Other messages are usually issued along with this message to further identify the operation that failed.
- System response: The current operation is terminated.
- User action: Verify that all of the required XPAF libraries are present and not corrupted. If you believe you are receiving this message in error, call Xerox Technical Support.

**UJL0308I**     *number resource* **PROCESSED.** *number* **WITH ERRORS**

Explanation:     The identified number of resources have been loaded. Some may have loaded with errors.

System response:     Resource loading is terminated. XOAF processing continues.

User action:     If no errors are indicated, no action is required. If errors occurred, review the XOAF log for more information.

**UJL0505E**     **OUTPUT DSNAME** *dataset name* **IS NOT A VSAM LIBRARY**

Explanation:     The named output dataset is not a VSAM dataset.

System response:     PDL loader processing is terminated.

User action:     Use a native VSAM dataset as the target library. If the problem persists, call Xerox Technical Support.

**UJL0601I**     **PDL LOADER COMPLETED SUCCESSFULLY FOR MEMBER** *name*

Explanation:     The PDL loader successfully processed the named member.

System response:     XOAF processing continues.

User action:     None

**UJL0602E**     **PDL LOADER COMPLETED UNSUCCESSFULLY FOR MEMBER** *name*

Explanation:     The PDL loader encountered errors when processing the named member.

System response:     XOAF processing continues.

User action:     Check the XOAFLOG and the UJLLIST output for more information. Correct any errors found and reload the resource. If the problem persists, contact Xerox technical support.

**UJL0701I**     *loader name* **COMPLETED** *status*

Explanation:     The named loader finished processing either successfully or unsuccessfully.

System response:     XOAF processing continues.

User action:     Check the system log for errors or for more information if it finished unsuccessfully. If the problem persists, call Xerox Technical Support.

**UJL1104E** *loader name* **ERROR: NO INPUT RECORDS FOUND IN INPUT MEMBER**

OR

*loader name* **ERROR: PCLVER NOT SUPPLIED, V35 ASSUMED**

Explanation: Either the PDL loader found no records to process or the PCLVER parameter was missing from the command.

System response: PDL loader processing is terminated. If the PCLVER was not supplied, then the default is used.

User action: If PDL loader processing is terminated, verify that the input member has records, and reload the PDL. No action is required for the latter message.

**UJL1107E** **INPUT FILE (*dataset name*) MUST BE A PARTITIONED DATASET**

Explanation: The dataset specified as input to the PDL loader is not a partitioned dataset (PDS). You must specify a PDS member as input to the PDL loader.

System response: PDL loader processing is terminated.

User action: Check the input dataset name and ensure a PDS is specified.

**UJL1109E** **VALIDATION ERRORS HAVE OCCURRED. SEE UJLLIST FOR DETAILS**

Explanation: The PDL loader encountered one or more validation errors in the PDL.

System response: PDL loader processing continues validating the remaining PDL.

User action: To locate the errors, examine the UJLLIST output. Correct the errors, and reload the PDL.

**UJL1117W** *file name* **IS NOT A PDL OBJECT FILE. FILE IS NOT LOADED**

Explanation: The object file being loaded is not a JDL, PDE, CME, TST, STK, IDR, or LIB file.

System response: The file is ignored and is not loaded.

User action: Make sure that you have specified the correct member name in your PDS library.

**UJL1121W** **MISSING XPDL COMPILER RESOURCE FILE. XPDL COMPILE NOT POSSIBLE**

Explanation: Explanation: The XPDL Compiler function was requested via the XPDL=YES XINSXOAF XINPARM parameter, but at least one of the required resource files is missing.

System response: System response: The PDL Loader loads the JSL, but the XPDL compile is not possible.

User action: User action: Insure that the invoking JCL has the correct DD statements for CON, MSG, INVXLT, PCCFIL, TYPFIL and XPDL DFT or change XPDL=YES to XPDL=NO if the XPDL compile function is not desired.

**UJL7501E**      **LDM** *command* **ERROR. EC=X'***error code*

Explanation:      An error occurred while attempting to access a PDS or native library. EC is the error code returned from LDM.

System response:      PDL loader processing is terminated.

User action:      Correct the problem identified by LDM. Other messages accompany this message and provide more information. If the problem persists, call Xerox Technical Support.

**UJL9099E**      **UNABLE TO ALLOCATE STORAGE FOR** *activity*

Explanation:      Storage was needed for the stated *activity* but could not be obtained.

System response:      PDL loader processing is terminated.

User action:      Be sure the region size is large enough to acquire work areas.

## ULL messages

---

### ULL0001I LOGO LOAD SUCCESSFULLY COMPLETED

Explanation: XOAF displays this message after successfully loading a logo. Input resources of the same name replace any resources that previously existed in the native library.

System response: Processing continues.

User action: None.

### ULL0126E UNABLE TO CLOSE *dataset name* DSNAME

Explanation: The #CLOSE macro issued a non-zero return code while attempting to close the named dataset.

System response: Processing continues. If there are no other errors, the dataset should be valid.

User action: Call Xerox Technical Support.

### ULL0303E FIRST RECORD OF *member name* IS NOT A VALID HEADER RECORD

OR

#### FIRST RECORD OF INPUT IS NOT A VALID HEADER RECORD

Explanation: The format of the dataset or member's first record does not conform to the Xerox header record format. If the input is a sequential dataset, the word INPUT is substituted for *member name* in the message text.

System response: Logo loader processing is terminated.

User action: Verify that the input is a valid logo. If the problem persists, call Xerox Technical Support.

### ULL1307E COULD NOT ALLOCATE AND OPEN *dataset name*. RC=X'return code'

Explanation: The indicated dataset was allocated and opened but could not complete successfully. The return code indicates the cause of the error.

System response: Processing is terminated.

User action: Depends on the return code:

- If RC=000C, the dataset or DASD volume is full. Provide more space for the dataset.
- If RC=0016, a problem external to XPAF is preventing the dataset from being accessed.
- If RC=0024, the region size is too small to hold the control block. Increase the region size.
- For any other return code, call Xerox Technical Support.

**ULL1403F**     **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *process name* **LDM PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO process description FILE DSNNAME dataset name**

Explanation:     RC is the return code from the LDM function. IC is the error code returned by the LCAERRCD field. This message is preceded by either message ULL1407F or MSF9900I, which provides more information about the result of this error.

System response:     The requested logo is not loaded.

User action:     Correct the problem identified by LDM, then try to load the logo again.

**ULL1404W**     **MINOR ERROR ENCOUNTERED BY** *module name* **DURING** *process name* **LDM PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO process description FILE DSNNAME dataset name**

Explanation:     RC is the return code from the LDM function. IC is the error code returned by the LCAERRCD field. This message is followed by message ULL1408W, which provides more information about this error.

System response:     Logo loading is not affected. XOAF processing continues.

User action:     Correct the problem identified by LDM, if possible. Otherwise, call Xerox Technical Support.

**ULL1406I**     **RESOURCE** *logo name* **LOADED SUCCESSFULLY**

Explanation:     This message is displayed on the XOAF panel following the successful loading of a specified logo.

System response:     XOAF processing continues.

User action:     None required.

**ULL1407F**     **FATAL ERROR. UNABLE TO LOAD RESOURCE. SEE LOG**

Explanation:     This message always follows message ULL1307E, ULL1403F, ULL1422E, or ULL1423E, and is displayed on the XOAF panel or batch listing after an unsuccessful attempt to load a specified logo.

System response:     The requested logo is not loaded.

User action:     Correct the problem identified by the associated messages, then try to load the logo again.

**ULL1408W**     **MINOR ERROR. LOAD RESOURCE SUCCESSFUL. SEE LOG**

Explanation:     This message always follows message ULL1404W or ULL3418E, and is displayed on the XOAF panel after loading a specified logo. This message indicates success by the logo loader, but failure by LDM or EI after the resource was loaded.

System response:     XOAF processing continues.

User action:     Correct the problem identified by the associated messages, if possible.

**ULL1422E     INPUT MEMBER NAME MUST BE PRESENT IF RESOURCE IS PDS OR CONTAINS NO HEADER**

Explanation:     When loading a centralized logo, the logo loader examines the header record to extract the name. No header record or name was found.

System response:     Logo loading is terminated.

User action:     If there is no header record, enter the name of the logo being loaded on the XOAF panel or in the TSO/batch command. For more information on the XOAF panel, refer to [Section Three: Managing Resources with XPAF](#). For more information on the TSO/batch command, refer to the *XPAF TSO/Batch Commands Quick Reference Card*.

**ULL1423E     UNABLE TO BUILD DIRECTORY LIST FOR DSNAME *dataset name*. LDM RC=*return code***

Explanation:     While attempting to load a centralized logo, the input member name was specified as an asterisk ( \* ), indicating that all members were to be loaded. An LDM BLDL for the input dataset failed. Further information can be found in the log.

System response:     Logo loading is terminated.

User action:     Examine the input dataset to ensure that it is a PDS. If so, call Xerox Technical Support.

**ULL1428W     LOAD COMPLETED. SOME RESOURCES NOT LOADED. SEE LOG FOR DETAILS**

Explanation:     The logo load completed; however, one or more resources could not be loaded.

System response:     XOAF processing continues.

User action:     Refer to the system log for a supplementary message which will identify the invalid resource(s).

**ULL3418E     I/O ERROR READING DSNAME=*dataset name*. RC=*X'*return code'**

Explanation:     An I/O error occurred while attempting to read the named dataset.

System response:     Processing continues.

User action:     Call Xerox Technical Support.

## ULR messages

---

### ULR0716I *member name* **RELOADED WITH USER DIRECTORY LENGTH 0**

- Explanation: While using the reload function of the XOAF Manage Libraries option to reload an offloaded PDS member to an XPAF library, the member was reloaded without user directory information.
- System response: The message is issued to the XOAF screen and to the XOAF log. The reload process is now complete.
- User action: Verify that the resource will function correctly without the user directory information. If unusable resources are produced, use the LDM batch offload/reload process as an alternative.

### ULR1104E *loader name* **ERROR: activity**

- Explanation: The output dataset could not be successfully opened or may be in use by another user.
- System response: The message is issued to the XOAF screen and to the XOAF log. The reload process is halted and is not completed.
- User action: Verify that the output dataset name and the output member name are valid, then reinitiate the reload process.

### ULR1107E **INPUT FILE (*dataset name*) MUST BE A PARTITIONED DATASET**

- Explanation: The input file is not a partitioned dataset. Sequential files are not supported for this utility.
- System response: The message is issued to the XOAF screen and to the XOAF log. The reload process is halted and is not completed.
- User action: Specify a partitioned dataset as the input to this loader utility, then reinitiate the reload process.

### ULR3015E **COULD NOT *command* LIBRARY *native library dataset name* DURING LDM RELOAD PROCESSING. LDM RC=X'return code'**

- Explanation: The specified command could not be performed for the indicated library during the LDM reload process. The return code is specified in the message.
- System response: The message is issued to the XOAF screen and to the XOAF log. The reload process is halted and is not completed.
- User action: Verify that the input and output dataset names and members are valid, then reinitiate the reload process.

**ULR3016E**     **COULD NOT** *command* **MEMBER** *member name* **OF LIBRARY** *library dataset name*  
**DURING LDM RELOAD PROCESSING. LDM RC=X'***return code'*

Explanation:     The specified command could not be performed for the indicated member of the referenced dataset.

System response:     The message is issued to the XOAF panel and to the XOAF log. The reload process is halted and is not completed.

User action:     Verify that the input and output dataset names and members are valid, then reinitiate the reload process.

**ULR3017E**     **COULD NOT** *command* **LCA DURING LDM RELOAD PROCESSING. LDM RC=X'***return code'*

Explanation:     The referenced command could not be performed for an LCA during the LDM reload function.

System response:     The message is issued to the XOAF panel and to the XOAF log. The reload process is halted and is not completed.

User action:     Verify that the input and output dataset names and members are valid, then reinitiate the reload process.

## UPL messages

---

### UPL0001I *message text*

Explanation: All resources have been loaded successfully to a native library. Input resources of the same name have replaced any resources that previously existed in the native library.

System response: XOAF processing continues.

User action: None required.

### UPL0126E **UNABLE TO CLOSE** *ddname* **DSNAME**

Explanation: This is an internal error.

System response: XOAF processing continues. If there are no other errors, the dataset is valid.

User action: Call Xerox Technical Support.

### UPL0505E **OUTPUT DATASET** *dataset name* **IS NOT A VSAM LIBRARY**

Explanation: The dataset specified as output for the form or image load is not a native library.

System response: The resource load is terminated.

User action: Specify a valid native library as output.

### UPL0710E **THE INPUT FILE MUST BE A PDS OR SEQUENTIAL DATASET**

Explanation: The dataset specified as input for the form or image load is not a sequential or partitioned dataset.

System response: The resource load is terminated.

User action: Ensure that you have not specified a native library as input for this function. Also verify that the correct dataset is specified.

### UPL1307E **COULD NOT ALLOCATE AND OPEN** *dataset name*. **RC=X**'return code'

Explanation: This is an internal error.

System response: Processing is terminated.

User action: Verify that the dataset specified is valid. If the problem persists, call Xerox Technical Support.

- UPL1401F      FATAL ERROR. UNABLE TO ACQUIRE WORKING STORAGE. LOAD UNSUCCESSFUL**
- Explanation: Because it is unable to acquire storage via the Environmental Intermedium, UPLMAIN cannot log messages. This message is displayed on an XOAF panel following an unsuccessful attempt to load a form or image.
- System response: The requested resource is not loaded.
- User action: Increase the task region size, then try again to load the resource.
- 
- UPL1402W      MINOR ERROR. UNABLE TO RELINQUISH WORKING STORAGE. LOAD SUCCESSFUL**
- Explanation: Because it is unable to release storage via the Environmental Intermedium, UPLMAIN cannot log messages. This message is displayed on an XOAF panel after a form or image resource has been loaded.
- System response: XOAF processing continues.
- User action: Correct the problem and continue loading any remaining resources.
- 
- UPL1403F      FATAL ERROR ENCOUNTERED BY *module name* DURING *process name* LDM PROCESSING. RC=X'*return code*'; IC=X'*information code*'. UNABLE TO *process description* FILE DSNNAME *dataset name***
- Explanation: RC is the return code from the LDM function. IC is the error code returned by the LCAERRCD field. This message is preceded by either message ULL1407F or MSF9900I, which provides more information about the result of this error.
- System response: The requested resource is not loaded.
- User action: Correct the problem identified by LDM, then try again to load the resource. If the problem persists, call Xerox Technical Support.
- 
- UPL1404W      MINOR ERROR ENCOUNTERED BY *module name* DURING *process name* LDM PROCESSING. RC=X'*return code*'; IC=X'*information code*'. UNABLE TO *process description* FILE DSNNAME *dataset name***
- Explanation: This is an internal error. Subsequent message(s) give more information.
- System response: Resource loading is not affected. XOAF processing continues.
- User action: Call Xerox Technical Support.
- 
- UPL1405F      FATAL ERROR ENCOUNTERED BY *module name* DURING RESOURCE LOAD PROCESSING. INPUT RECORD TOO LARGE FOR OUTPUT BUFFER. RESOURCE *resource name* NOT LOADED INTO LIBRARY *dataset name***
- Explanation: An input record is larger than the maximum output record size. Subsequent message(s) give more information.
- System response: The requested resource is not loaded.
- User action: Correct the identified problem, then try again to load the resource. If the problem persists, call Xerox Technical Support.

**UPL1406I      RESOURCE *resource name* LOADED SUCCESSFULLY**

Explanation:      XOAF displays this message after successfully loading a form or image. Input resources of the same name replace any resources that previously existed in the native library.

System response:      Processing continues.

User action:      None.

**UPL1407F      FATAL ERROR. UNABLE TO LOAD RESOURCE. SEE LOG**

Explanation:      This message always follows other messages and is displayed on an XOAF panel or batch listing following an unsuccessful attempt to load a form or image.

System response:      The requested resource is not loaded.

User action:      Correct the problem identified by the associated messages, then try again to load the resource. If the problem persists, call Xerox Technical Support.

**UPL1408W      MINOR ERROR. LOAD RESOURCE SUCCESSFUL. SEE LOG**

Explanation:      This message always follows other messages, and is displayed on an XOAF panel after a form or image has been loaded.

System response:      XOAF processing continues.

User action:      Correct the problem identified by the associated messages, if possible. Continue with the next resource load function.

**UPL140AW      RESOURCE *member* IS A FONT AND WILL NOT BE LOADED**

Explanation:      When attempting to load Centralized images, XOAF has encountered a font.

System response:      The resource is not loaded. Processing continues.

User action:      None.

**UPL1421E      MEMBER *member name* IN *dataset name* DOES NOT CONTAIN A VALID HEADER RECORD. RESOURCE NOT LOADED**

Explanation:      The named member did not contain a valid header record. XOAF could not load the resource.

System response:      Processing is terminated.

User action:      Correct the form or image and resubmit the job.

**UPL1422E INPUT MEMBER NAME MUST BE PRESENT IF RESOURCE IS PDS**

Explanation: A centralized form or image was being loaded from a PDS, but the PDS member name was not supplied.

System response: Resource loading is terminated.

User action: At the ISPF panel or in the TSO/batch command, enter the PDS member name to be loaded in the input member name. For information on the TSO/batch command, refer to *XPAF TSO/Batch Commands Quick Reference Card*.

**UPL1423E UNABLE TO BUILD DIRECTORY LIST FOR DSNAME *dataset name*. LDM RC=*return code***

Explanation: While attempting to load forms or images, the input member name was specified as an asterisk ( \* ), indicating that all members of a PDS were to be loaded. More information can be found in the log.

System response: Resource loading is terminated.

User action: Verify that the input dataset is a PDS. If so, call Xerox Technical Support.

**UPL1425E *input* MEMBER *member name* OF DSNAME *dataset name* IS EMPTY**

Explanation: The named member in the named dataset does not contain any data.

System response: Command processing is terminated.

User action: Ensure that the specified member contains the resource to be loaded.

**UPL1426E *input* DSNAME *dataset name* IS EMPTY**

Explanation: The sequential dataset named as input does not contain any data.

System response: Command processing is terminated.

User action: Ensure that the specified sequential dataset contains the resource to be loaded.

**UPL1429E OUTPUT MEMBER NAME MUST BE PRESENT IF RESOURCE IS SEQUENTIAL FILE WITH NO HEADER**

Explanation: A centralized form or image was being loaded from a sequential file, but there was no header record in the resource to identify the resource name.

System response: Resource loading is terminated.

User action: At the ISPF panel or in the TSO/batch command, enter the member name to be loaded in the output member name. For information on the TSO/batch command, refer to *XPAF TSO/Batch Commands Quick Reference Card*.

**UPL1427I**     *module name:* **LENGTH OF resource 'resource name' IS LESS THAN THE LENGTH SPECIFIED IN HEADER. RESOURCE NOT LOADED**

Explanation: While loading centralized forms or images to the appropriate library, XOAF encountered an invalid resource. The resource length specified in the header is greater than the actual length of the member.

System response: XOAF processing continues. Any remaining valid resources are loaded.

User action: Examine the named resource to verify that it is the correct type. For example, make sure you are not trying to load a font into the centralized form library. If the resource is valid, call Xerox Technical Support.

**UPL1428W**     **LOAD COMPLETED. SOME RESOURCES NOT LOADED. SEE LOG FOR DETAILS**

Explanation: The form or image load completed; however, one or more resources could not be loaded. Message UPL1427I, which identifies the invalid resource(s), is written to the system log for each error encountered.

System response: XOAF processing continues.

User action: Refer to the user action for message UPL1427I.

**UPL3010F**     **COULD NOT GET X'number of bytes' BYTES OF MEMORY** *activity*

Explanation: This is an internal error.

System response: Processing is terminated.

User action: Call Xerox Technical Support.

**UPL3011E**     **COULD NOT RELEASE X'number of bytes' BYTES OF MEMORY FROM LOCATION X'address'** *activity*

Explanation: This is an internal error.

System response: Processing may continue.

User action: Call Xerox Technical Support.

**UPL3418E**     **I/O ERROR READING DSNAME=dataset name. RC=X'return code'**

Explanation: An I/O error occurred while reading the indicated dataset via the Environmental Intermedium. This error occurred while attempting to load forms or images.

System response: Resource loading is terminated.

User action: Correct the identified problem, then continue with the next resource load function. If the problem persists, call Xerox Technical Support.

**UPL4211E      LOGICAL RECORD LENGTH OF *ddname* DATASET MUST BE *nnn***

Explanation:    The indicated resource dataset does not have a logical record length of the indicated number of bytes.

System response:    Command processing is terminated, and the form is not loaded.

User action:        Transfer the resource to a dataset that has a logical record length of the indicated number of bytes.

## UTB messages

---

**UTB0201E**    **COMMON WORK AREA ADDRESS WAS ZERO FOR MODULE** *module name*. **RC=X'***return code'*

Explanation:    This is an internal error.  
 System response:    XOAF processing is terminated.  
 User action:    Call Xerox Technical Support.

**UTB0202E**    **THM UNABLE TO ACQUIRE TCB FOR MODULE** *module name*. **RC=X'***return code'*

Explanation:    The THM GETTCB request failed for the named module.  
 System response:    XOAF processing is terminated.  
 User action:    This error may be due to insufficient storage. Increase the region size and retry the option. If the option fails again for the same reason, call Xerox Technical Support.

**UTB0203E**    **THM ERROR IN MODULE** *module name*. **CMD=***thm command*; **IC=X'***thm-information code*'; **RC=X'***thm-return code'*

Explanation:    While attempting to process an XPAF VSAM dataset, an unexpected error was encountered. Other messages are usually issued along with this message to further identify the operation that failed.  
 System response:    The current operation is terminated.  
 User action:    Verify that all of the required XPAF libraries are present and not corrupted. If you believe you are receiving this message in error, call Xerox Technical Support.

**UTB0204E**    *option* **FAILED. TABLE** *table name* **NOT FOUND IN DSNAME** *dataset name*

Explanation:    The identified option was attempted for the named table; however, the table could not be found in the named dataset.  
 System response:    The requested option fails. XOAF processing continues.  
 User action:    Ensure that you have specified a valid table name and dataset name, then retry the option.

**UTB0205I**    **TABLE** *list name* **HAS BEEN DELETED FROM DSNAME** *dataset name*

Explanation:    The named list was deleted successfully from the specified dataset.  
 System response:    XOAF processing continues.  
 User action:    None required.

**UTB0206E**     *option* **FAILED FOR** *dataset name.* **DSNAME INVALID**

Explanation:     The identified option was attempted for the named dataset, but the dataset name was not specified according to z/OS standards or was blank.

System response:     The requested option fails. XOAF processing continues.

User action:     Correct the dataset name, then retry the option.

**UTB0207E**     *option* **FAILED FOR** *table list name.* **NAME INVALID**

Explanation:     The identified option was attempted for the named list, but the list name was not specified according to IBM standard naming conventions or contained spaces.

System response:     The requested option fails. XOAF processing continues.

User action:     Correct the list name, then retry the option.

**UTB0208E**     *option* **FAILED FOR TABLE** *list name* **BECAUSE TYPE CODE** *type code* **IS INVALID**

Explanation:     This is an internal error.

System response:     XOAF processing is terminated.

User action:     Call Xerox Technical Support.

**UTB0209I**     *update* **FAILED BECAUSE** *list name* **IS NOT A** *list type* **TABLE TYPE**

Explanation:     The identified resource list could not be updated because it contained the wrong type of resource.

System response:     The list update fails. XOAF processing continues.

User action:     Select a list that is of the correct type. For example, if you wish to update a font list, ensure that the list you specify contains fonts.

**UTB020AI**     **TABLE** *list name* **HAS BEEN UPDATED SUCCESSFULLY**

Explanation:     The identified resource list was updated correctly.

System response:     XOAF processing continues.

User action:     None required.

**UTB020BI**     **NO UPDATES REQUESTED FOR TABLE** *list name*

Explanation:     While using the option to update a resident resource list, you did not specify any entries.

System response:     XOAF processing continues.

User action:     None required.

**UTB020CE**     **FUNCTION=***function type* **FAILED. TABLE TYPE** *type* **INVALID. MUST BE FNTL OR FRML**

Explanation:     The indicated function (A=Add, C=Change, D=Delete) could not be completed because the list type was invalid. The list type must be FNTL or FRML.

System response:     The requested option fails. XOAF processing continues.

User action:     Correct the TYPE parameter and resubmit the job.

**UTB020DE**     *option* **FAILED BECAUSE ITEM** *list member name* **IS ALREADY IN TABLE** *list name*

OR

*option* **FAILED BECAUSE ITEM** *list member name* **IS NOT IN TABLE** *list name*

Explanation:     The indicated *option* failed because the named item either already existed or did not exist in the list.

System response:     XOAF processing is terminated.

User action:     Correct the item name, then try the request again.

**UTB020EE**     **FUNCTION** *function type* **INVALID. MUST BE (A)DD OR (D)ELETE**

Explanation:     The indicated function is not valid.

System response:     XOAF processing is terminated.

User action:     Correct the error, then try the request again.

**UTB020FI**     **ITEM** *list item name* **SUCCESSFULLY** *action* **TABLE LIST NAME**

Explanation:     The indicated item was successfully added to, changed in, or deleted from the named list.

System response:     XOAF processing continues.

User action:     None required.

**UTB0215E**     *action* **FAILED. UNABLE TO GET DIRECTORY LIST FOR DSNAME** *dataset name*  
**MEMBER** *member name*

Explanation:     While searching for the member specified in the FROM parameter, an error occurred reading the directory of the named source dataset.

System response:     XOAF processing is terminated.

User action:     Make sure the dataset exists and is a PDS. If it does exist and it is a PDS, call Xerox Technical Support.

- UTB0216E**    *action* **FAILED. SOURCE MEMBER** *list member name* **IS LOCATED IN** *list library name*  
OR  
*action* **FAILED. SOURCE MEMBER** *list member name* **IS NOT LOCATED IN** *list library name*
- Explanation:    The specified member did not exist in the named dataset.  
System response:    XOAF processing is terminated.  
User action:    Ensure that the specified source member name is correct, then rerun the request. If the request fails again, call Xerox Technical Support.
- UTB0217E**    *allocation* **FAILED. UNABLE TO ALLOCATE** *list ddname/list library name. RC=X'return code'*
- Explanation:    Dynamic allocation of the dataset specified in the FROM parameter failed.  
System response:    XOAF processing is terminated.  
User action:    Ensure that the provided name is correct and that the dataset has enough storage to allow allocation. If so, call Xerox Technical Support.
- UTB0218E**    *action* **FAILED. UNABLE TO OPEN** *list ddname/list library name. RC=X'return code'*
- Explanation:    This is an internal error.  
System response:    XOAF processing is terminated.  
User action:    Call Xerox Technical Support.
- UTB0219E**    *action* **FAILED. MEMBER NAME** *list member name* **INVALID**
- Explanation:    The member name specified in the FROM parameter is incorrect according to standard naming conventions.  
System response:    XOAF processing is terminated.  
User action:    Correct the member name according to standards, then rerun the request.
- UTB021AE**    *action* **FAILED. UNABLE TO ACQUIRE** *bytes of storage* **BYTES OF STORAGE FOR** *area. RC=X'return code'*
- Explanation:    The indicated action was unable to acquire the indicated number of bytes for the named area.  
System response:    XOAF processing is terminated.  
User action:    Increase the region size and rerun the request. If the problem persists, call Xerox Technical Support.

**UTB021BE ACTION FAILED. UNABLE TO READ INPUT DSNAME** *dataset name. RC=X'return code'*

Explanation: An error occurred while reading the named dataset.  
 System response: XOAF processing is terminated.  
 User action: Ensure that the dataset name is specified according to standard naming conventions, then rerun the request. If the problem persists, call Xerox Technical Support.

**UTB021CI TABLE** *list name* **CREATED WITH** *number of list entries* **ITEMS IN DSNAME** *list library name*

Explanation: The named list was created successfully in the named dataset with the specified number of items.  
 System response: XOAF processing continues.  
 User action: None required.

**UTB021DE ACTION FAILED FOR** *list name* **IN** *list ddname/list library name. DEVICE TYPE UNDEFINED*

Explanation: This is an internal error.  
 System response: XOAF processing is terminated.  
 User action: Call Xerox Technical Support.

**UTB021EE ERROR OCCURRED IN IBM SYSTEM MACRO** *operation. IC=X'information code'; RC=X'return code'*

Explanation: An XPAF internal error occurred while using an IBM system macro. RC contains the contents of register 15, and IC contains any information codes available for the named macro.  
 System response: XOAF processing is terminated.  
 User action: Refer to the IBM publication that lists the return codes associated with IBM system macros. If the problem persists, call Xerox Technical Support.

**UTB0220E DATASET** *'list library name'* **NOT FOUND**

Explanation: The named dataset was not found.  
 System response: XOAF processing is terminated.  
 User action: Supply a valid dataset name that is cataloged, then try the request again.

**UTB4010E TABLE** *list name* **ALREADY EXISTS**

Explanation: The named list was not created because a list of the same name already exists.  
 System response: XOAF processing is terminated.  
 User action: To create a new list, enter a unique name.

**UTB6209E**    **INVALID FUNCTION** *invalid function* **PASSED TO** *module name*

Explanation:    This is an internal error.  
System response:    XOAF processing is terminated.  
User action:    Call Xerox Technical Support.

**UTB6210W**    **TABLE** *thm list* **EXISTS. ENTER FONTS TO RELOAD TABLE OR 'CANCEL'**

Explanation:    The specified list name already exists. This message is displayed while loading a font list table.  
System response:    XOAF processing continues.  
User action:    Continue entering fonts to reload the list, or enter **CANCEL** to keep the list in its current form.

**UTB6211E**    *operation failed.* **DUPLICATE ENTRY ON** *dataset name* **MEMBER:** *member name*

Explanation:    The THM request failed, due to the duplicate entry on the input dataset.  
System response:    XOAF processing is terminated.  
User action:    Edit the input dataset and remove the duplicate entry. Then retry the option.

## XAC messages

---

### **XAC023AI     CONVERTING CHARACTER SET** *character-set-name*, **POINT SIZE** *ps*.

Explanation:     The named character set, with a point size of “ps” is being converted  
 System response:     Processing continues  
 User action:     None.

### **XAC023BI     CREATING FONTS** *nameI/J/L/P FOR PLANE pp, nnn* **CHARACTERS**.

Explanation:     Replica fonts with a font names of *nameL*, *nameJ*, *nameL* and *nameP* are being created for replica plane *pp*. The fonts will contain *nnn* characters.  
 System response:     Processing continues  
 User action:     None.

### **XAC023CI     REPLICA LCDS FNT** *name* **CREATED SUCCESSFULLY**

Explanation:     The LCDS version of replica font *name*, has been successfully created and stored in CFONTLIB.  
 System response:     Processing continues  
 User action:     None.

### **XAC023DE     REPLICA LCDS FNT** *name* **CREATED UNSUCCESSFULLY**

Explanation:     An error occurred when attempting to create the LCDS version of replica font, *name*.  
 System response:     Processing continues  
 User action:     Review the log to see if there are any messages that may indicate the cause of the problem. If you are unable to rectify the problem, contact Xerox technical support.

### **XAC023EI     REPLICA XES FONT** *name* **CREATED SUCCESSFULLY**

Explanation:     The LCDS version of replica font *name*, has been successfully created and stored in DFONTLIB.  
 System response:     Processing continues  
 User action:     None.

### **XAC023OI     CREATING NEW I2X TABLE ENTRY FOR CHARACTER SET** *cs-name*

Explanation:     XOAF did not find an existing entry for the character set, *cs-name*, in the XPAFI2X entry so will create a new one.  
 System response:     Processing continues  
 User action:     None.

**XAC0231E INPUT CHARACTER SET RESOLUTION OF *nnn* DPI IS NOT CURRENTLY SUPPORTED. *cs-name* WILL NOT BE CONVERTED**

- Explanation: The resolution of the character set, *cs-name*, is not currently supported. The character set will not be converted.
- System response: Processing of the named character set is aborted.
- User action: Find a 300dpi equivalent of the character set you want to convert and run the conversion against the 300dpi character set.

**XAC0232F NO OUTPUT LIBRARY HAS BEEN PROVIDED. SPECIFY A CFONTLIB OR DFONTLIB DD CARD**

- Explanation: Neither a CFONTLIB or DFONLTB output library has been specified.
- System response: Processing is aborted.
- User action: Add either a CFONTLIB or DFONTLIB, or both, DD card to the XOAF batch JCL and re-run the job.

**XAC0233W MORE THAN *nn* ITEMS REQUIRED IN THE XPAFI2X TABLE**

- Explanation: During conversion of an AFP character set, XOAF has determined that more than 20 replica fonts, "items", are required in the XPAFI2X table.
- System response: Processing continues.
- User action: The additional XPAFI2X entries are most likely for custom characters that are not used in everyday job output. Print some sample jobs and verify that all characters required by your documents are printed. If some characters are not available, contact Xerox Technical Support.

**XAC0234W CHARID *charid* HAS BEEN ASSIGNED CODE POINT X'xx' IN CUSTOM PLANE *plane***

- Explanation: A new character identifier, *charid*, has been detected during the conversion process. The character is assigned the ASCII code point X'xx' in the specified plane and the IPSTND table is updated.
- System response: Processing continues.
- User action: This message is for information purposes and usually no action is required. If you want to change the location of the character, you can do so by updating the IPSTND table via the XOAF ISPF panels and then reconverting the character set.

**XAC0235W CHARID *charid* COULD NOT BE ADDED TO THE IPSTND TABLE. *Reason-text***

- Explanation: An error occurred while trying to add a new entry to the IPSTND table, for the reason specified in the *reason-text*.
- System response: Processing continues.
- User action: Review the log for previous messages that may indicate the cause of the problem and help you resolve the issue. If you are unable to resolve the issue, contact Xerox Technical Support.

**XAC0236W    COULD NOT FETCH THE XPAFI2XX ENTRY FOR CHARACTER SET** *character-set*

Explanation:    The existing XPAFI2X table entry for character set *character-set*, has the flag set indicating that an XPAFI2XX should also exist for this character set. However, XPAF is unable to find the corresponding XPAFI2XX entry.

System response:    Processing continues. XPAF will build a new XPAFI2XX entry.

User action:    Try to determine why the XPAFI2XX entry does not exist when indicated by the XPAFI2X entry. If you are unable to resolve the issue, contact Xerox Technical Support.

**XAC0237E    ERROR DETECTED WHEN CHECKING FONT LIBRARY FOR POSSIBLE EXISTING FONT**  
*font* **SEE LOG FOR DETAILS**

Explanation:    When checking the existing centralized or decentralized font library, before assigning a new name to a replica font, an error occurred.

System response:    Processing continues.

User action:    Review the log for preceding error messages that may indicate why the failure occurred and resolve the issue.

**XAC0238I    *nnn* CHARACTER SET(S) CONVERTED. *rrr* REPLICA FONTS CREATED, *eee* WITH ERRORS**

Explanation:    This is a summary message indicating the total number of character sets processed, the number of replica fonts created and the number of errors.

System response:    Processing continues.

User action:    None.

## XAE messages

---

**XAE0001I    *message text***

Explanation:    *Message text* consists of a message produced by another component. Refer to the chapter of the specified component for an explanation of this message.

System response:    Refer to the documentation for the specified component.

User action:    Refer to the documentation for the specified component.

**XAE0700E    AN ERROR HAS OCCURRED IN PROCESSING. SEE LOG FOR MORE INFORMATION**

Explanation:    This message appears when any error occurs building IBM-related tables.

System response:    Depends on the error messages in the XLOG.

User action:    Depends on the error messages in the XLOG.

**XAE4201E UNEXPECTED END OF FILE WHILE READING** *member name*

Explanation: While converting a centralized form to decentralized format, an end-of-file condition was reached before processing was completed.

System response: Processing is terminated with incomplete output.

User action: Check the log for related messages. Verify that the input form member has not been corrupted during a MOVE or COPY and that it is not empty. If you cannot locate the problem, call Xerox Technical Support.

**XAE4202E XEI COULD NOT READ** *member name*. **RC=X**'return code'

Explanation: This is an internal error.

System response: Processing is terminated with incomplete output.

User action: Call Xerox Technical Support.

**XAE4203E FAILURE DURING TABLE FETCH. THM EC=***error code*

Explanation: This is an internal error.

System response: Processing is terminated with incomplete output.

User action: Call Xerox Technical Support.

**XAE4204E LDM FAILURE WRITING UDK OUTPUT. LDM EC=***error code*

Explanation: This is an internal error.

System response: Processing is terminated with incomplete output.

User action: Call Xerox Technical Support.

**XAE4205E MISSING OR INVALID** *item dataset name*

Explanation: The missing or invalid item is required and must conform to z/OS naming conventions.

System response: Processing is terminated.

User action: Ensure that the item is correct and try again.

**XAE4206E CANNOT USE SAME DSNAME FOR BOTH OUTPUT AND INPUT**

Explanation: The output dataset name and member are the same as the input dataset name and member.

System response: Processing is terminated.

User action: Specify an output dataset name/member combination that is different from the input dataset name/member. Retry the option.

**XAE4207E      MODULE *module name* NOT IN MEMORY**

Explanation:      This is an internal error.  
 System response:      Processing is terminated.  
 User action:      Call Xerox Technical Support.

**XAE4208E      *type of fail.* **EC=X'***error code'*, **DSNAME=***dataset name***

Explanation:      An error occurred accessing the named dataset.  
 System response:      Processing is terminated with incomplete output.  
 User action:      Examine the type of fail and error code for information on the error condition. Ensure the dataset and member specified as input exist. If unable to resolve, call Xerox Technical Support.

**XAE4210I      **CENTRALIZED FORM** *form name* **CONVERTED OK TO DECENTRALIZED FORM** *form name***

Explanation:      Form conversion completed successfully.  
 System response:      Processing continues.  
 User action:      None required.

**XAE4211E      **LOGICAL RECORD LENGTH OF** *dataset description* **DSNAME MUST BE** *nnn* **BYTES****

Explanation:      The indicated resource dataset does not have a logical record length of the indicated number of bytes.  
 System response:      Command processing is terminated.  
 User action:      Transfer the resource to a dataset that has an LRECL of the indicated number of bytes.

## XAM messages

---

### **XAM0001I     INCONSISTENCY BETWEEN TARGET PRINTER AND PRINTENV=COLR; PRINTENV=BOTH FORCED FOR THIS DOCUMENT**

- Explanation: A discrepancy exists between the target printer (monochrome) and the value specified in the PRINTENV initialization parameter (COLR). This discrepancy may cause a potential performance problem.
- System response: Processing continues with a temporary setting of PRINTENV=BOTH for this document. This modification will maintain the integrity of the printed document, but may result in unnecessary overhead.
- User action: Either correct the value for the PRINTENV initialization parameter, or use only highlight color printers. The printed document is unaffected by this discrepancy, but processing time may be increased significantly. Also, additional members may be created in the centralized image library that will never be referenced again, thus possibly wasting disk space.
- XPAF will automatically correct any adverse processing caused by a discrepancy the next time those resources are referenced after the problem has been fixed. However, the correction process takes time and may result in additional processing overhead.

### **XAM2124E     ERROR activity LIBRARY library ddname library dataset name. LDM RC=X'return code'; IC=X'information code'**

- Explanation: A VSAM read error occurred while accessing the named library.
- System response: Document processing is terminated.
- User action: Make a note of the return codes. If the problem persists, call Xerox Technical Support.

### **XAM3010F     COULD NOT GET X'amount' BYTES OF MEMORY activity**

- Explanation: Sufficient storage was unavailable for the conversion program to obtain the requested amount for the required data buffer.
- System response: The resource cannot be converted. Document processing is terminated. The document remains in the output buffer.
- User action: Increase the region size allocated to the XOSF start-up proc, or drain the other printers, then retransmit the document. If the problem persists, call Xerox Technical Support.

### **XAM3011E     COULD NOT RELEASE X'amount' BYTES OF MEMORY FROM LOCATION X'address' activity**

- Explanation: The storage used for conversion processing was not released, and the document may be incorrect. This is an internal error.
- System response: Document processing continues.
- User action: Call Xerox Technical Support.

**XAM3016E**    **COULD NOT** *command* **MEMBER** *member name* **OF LIBRARY** *library ddname resource type library*. **LDM RC=X'***return code'*

Explanation:    XPAF could not perform the named command on the specified member.  
System response:    Document processing is terminated.  
User action:    Ensure the member exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XAM3018E**    **COULD NOT ACQUIRE TCB** *activity*. **THM RC=X'***return code'*

Explanation:    This is an internal error.  
System response:    Document processing is terminated.  
User action:    Call Xerox Technical Support.

**XAM3725F**    **INVALID PIPELINE REQUEST:** *invalid request*

Explanation:    This is an internal error.  
System response:    Document processing is terminated.  
User action:    Call Xerox Technical Support.

**XAM4004F**    *module name* **DETECTED AN INVALID** *control block name* **CONTROL BLOCK AT LOCATION X'***address'*

Explanation:    This is an internal error.  
System response:    The overlay cannot be converted to a Xerox form. Document processing is terminated. The document remains in the output queue.  
User action:    Call Xerox Technical Support.

**XAM4006E**    **COULD NOT FIND** *table type* **TABLE**. **THM IC=X'***information code'*; **RC=X'***return code'*

Explanation:    This is an internal error.  
System response:    Document processing is terminated.  
User action:    Call Xerox Technical Support.

**XAM4023E PAPERSIZ=*paper size parameter* IS INVALID. LETTER ASSUMED**

Explanation: An invalid paper size value was specified in one of these parameters/keywords:

- Initialization parameter
- Printer profile parameter
- Extended JCL keyword

System response: Processing continues using 8.5 x 11 inch (LETTER) paper size.

User action: Correct the *paper size parameter* by entering a user-defined name that matches an entry in the currently active paper name table or one of these values:

#7  
#10  
A3  
A4  
A5  
A6  
B4  
B5  
C5  
DL  
EXEC  
LEGAL  
LEGL13  
LETTER  
LONG  
POST  
STATMT

**XAM4110E THE BUFFER MANAGER REPORTED AN ERROR TO MODULE *module name*. RC=X'*return code*'**

Explanation: This is an internal error.

System response: Document processing is terminated.

User action: Call Xerox Technical Support.

**XAM4116W OVERLAY CONSOLIDATION FAILED. DOCUMENT PROCESSING CONTINUES**

Explanation: XOSF encountered an error while consolidating the overlays in a copy group. This message is accompanied by other messages that provide more information about the error.

System response: Document processing continues. The overlays are processed as if consolidation had not been selected.

User action: None required.

**XAM414FE** *buffer name* **BUFFER CAPACITY EXCEEDED**

Explanation: The end-of-page processor buffers the page text fragments and overlay text fragments that comprise a page. The maximum amount of data that can be contained in the page buffer has been exceeded.

System response: Document processing is terminated.

User action: The document includes one or more pages that are too complex to be printed. If the document uses more than one medium overlay on any page, specify MERGEOVL=Y. This will combine all the overlays for a page into a single .FRM, reducing the size and complexity of the page buffer.

**XAM4301W** *X'unsupported control character'* **IS NOT A SUPPORTED** *control type* **CONTROL CHARACTER. SPACE 1 LINE IS ASSUMED**

Explanation: XAMLINE maintains a table of valid line printer carriage control characters. The line-mode data being transformed has machine carriage control characters, but the value of the named carriage control character was not found in the table.

System response: Document processing continues.

User action: If the control character is valid, call Xerox Technical Support. If the control character is invalid, determine if it is a valid ASA control character. If it is, resubmit the document and specify the correct record format in the DCB parameter for the file being printed.

**XAM4302W** *X'control character'* **IS A RESERVED** *machine* **CONTROL CHARACTER. DATA RECORD NOT PRINTED**

Explanation: Certain machine carriage control codes are reserved for printers. Printers ignore these codes and they produce no output.

System response: Document processing continues.

User action: Correct the data stream to use only valid output control commands. Reserved machine control codes are 02, 03, 04, 05, 06, 07, 0A, 12, 23, 43, 63, 6B, EB, FB, and F3.

**XAM4303W** **SKIP TO CHANNEL** *channel number* **NOT SUPPORTED IN** *resource name*. **SPACE 1 LINE IS ASSUMED**

Explanation: XAMLINE searched all Line Descriptor records for the channel number specified in the carriage control character but did not find it in the named resource.

System response: Document processing continues.

User action: If the channel is specified in the named resource, call Xerox Technical Support. Otherwise, use one of these solutions:

- If the data stream is an AFP data stream, insert an Invoke Data Map structured field that names the correct data map.
- Modify the resource so that it supports the named channel.
- Change the data so that it does not call for the named channel.

**XAM4310E UNABLE TO PRINT VARIABLE DATA USING MEDIUM MAP *map name* IN FORMDEF *formdef name* DUE TO CONSTANT FORM SPECIFICATION. *action***

Explanation: The conversion program has determined that the document contains variable data that will be printed using the named medium map in the named FORMDEF. However, the medium map calls for either one of two specifications that do not permit variable data:

- Constant forms on both sides in a duplex job
- Constant forms on the front of a simplex job

System response: Document processing is terminated.

User action: You have two alternatives:

- Remove CONSTANT BOTH (for duplex jobs) or CONSTANT FRONT (for simplex jobs) from the medium map.
- Use an IMM structured field to change medium maps before the variable data.

If the problem persists, call Xerox Technical Support.

**XAM4328F ERROR DETECTED PROCESSING *resource type resource member name* IN *document part***  
OR

**ERROR DETECTED PROCESSING INLINE PAGEDEF/FORMDEF IN *document part***

Explanation: The resource processor detected an error in the input data stream while trying to convert an IBM AFP resource. The resource member name is displayed without its 2-character prefix. For example, a page segment named S1SAMP is identified in the message as SAMP. The document part is either DOCUMENT, AFPJOBHDR, AFPJOBTLR, AFPMSGDS or AFPDSHDR, referring to either the document itself or one of the AFP banner types.

System response: In most cases, document processing is terminated. If the resource is an inline PAGEDEF or FORMDEF, document processing may continue using the default values. If document processing is terminated, the document remains in the output queue.

User action: To help diagnose and resolve the problem, investigate any related messages issued by XRF. If the named resource is a page segment, check the printed output to verify correct text positioning. If processing is terminated, make sure the resource is called by a valid name in the data stream. Try to correct the problem and rerun the job. If the problem persists, call Xerox Technical Support.

**XAM4329E REQUESTED *map type map name* NOT FOUND IN *resource type resource name***

- Explanation: While processing a page format or an IDM structured field, the transform could not find the named copy modification, page layout, or data map in the named resource.
- System response: Document processing is terminated.
- User action: Make sure the required page format or PAGEDEF is present in the resource library. If resource libraries are concatenated, make sure the resource in error is stored in the first library in the chain. If not:
- Delete or rename any earlier libraries with resources of the same name, then use the XPAF operator command to refresh the resource directory.
  - Rearrange the datasets in the concatenation to place the desired library at the head of the chain.

**XAM4330E CONDITIONAL PROCESSING CONTROL ID *id* NOT FOUND IN PAGEDEF *pagedef name***

- Explanation: While processing the line controls within PAGEDEF or page format for an page-formatted or AFP job, XPAF encountered a reference to a conditional processing test that was not included in the PAGEDEF or page format.
- System response: Document processing is terminated.
- User action: Locate a corrected copy of the PAGEDEF or page format, load it into your PDEFLIB, refresh the library directory, then resubmit the job.

**XAM4331E INVALID INLINE *resource type* STRUCTURED FIELD IS X'*structured field id*'**

- Explanation: While processing an inline PAGEDEF or FORMDEF, the conversion program found that the structured field to be processed was not part of a PAGEDEF or FORMDEF.
- System response: Document processing is terminated.
- User action: Correct the inline resource and resubmit the documents.

**XAM4333W INVALID STRUCTURED FIELD ID X'*structured field id*' FOUND. CHECK OUTPUT FORMATTING**

- Explanation: A 5A input record contained the named invalid structured field ID.
- System response: Document processing continues without processing the 5A record.
- User action: Check the output format for correctness. Make sure the structured field ID is valid and the introducer length is correct.

**XAM4334E COMPOSED TEXT CONTROL LENGTH OR CHAINING ERROR ENCOUNTERED**

- Explanation: During processing of an AFP presentation text (CTX) block, an invalid CTX control chain or sequence has been encountered.
- System response: The remainder of the CTX block is ignored, but processing of the page or resource continues.
- User action: Check the CTX controls and freestanding text records for invalid chaining, sequence, or length errors. If the error occurs within an overlay, the overlay should be revised via auto revision or the REVOVLY.

**XAM4336E UNSUPPORTED CTX CONTROL ENCOUNTERED: ctx\_control**

- Explanation: During processing of an AFP composed text (CTX) block, an unsupported triplet was encountered.
- System response: The unsupported CTX triplet is ignored, processing of the remainder of the CTX block continues.
- User action: Check the CTX block and remove the unsupported triplet(s).

**XAM4337W UNSUPPORTED PTX SEC COLOR SPACE ENCOUNTERED: xx**

- Explanation: While converting an AFP document a PTX structured field was encountered that contained a Set Extended Color triplet that called for a color space that is not recognized.
- System response: The SEC triplet is ignored and the color is not changed.
- User action: Check the AFP data stream to make sure the color space is valid. If so, contact Xerox Technical Support.

**XAM4338W PTX SEC cspace COLOR SPACE IS NOT SUPPORTED AND IS IGNORED**

- Explanation: While converting an AFP document a PTX structured field was encountered that contained a Set Extended Color triplet that referred to a color space that is not supported.
- System response: The SEC triplet is ignored and the color is not changed.
- User action: Check the AFP data stream to make sure the color space is valid. If so, contact Xerox Technical Support.

**XAM4354E CHECKPOINT (#CKPT) FAILED IN MODULE *module name*. RC=X'return code'**

- Explanation: An error was returned by the operating system when XPAF tried to determine if a document had reached the threshold for taking a checkpoint.
- System response: Document processing is terminated.
- User action: Verify that there is not a problem with your job entry subsystem or with the document as stored by the operating system. If the problem persists, call Xerox Technical Support.

**XAM530FE ENTRY *font* NOT FOUND IN XPAFAFW. THM IC='code'**

- Explanation: The fetch process failed when processing the XPAFAFW table for a replica font.
- System response: Document processing is terminated.
- This error usually indicates an error with font installation to the native libraries. If you have recently installed new or updated fonts, review the procedure for resource installation in [Section Two: Installing and Customizing XPAF](#).
- User action: to determine if the steps were completed correctly. If the problem persists, call Xerox Technical Support.

**XAM6280I XEROX .FRM FILE SIZE EXCEEDED FOR OVERLAY RESOURCE NAMED *name* (M).**

- Explanation: A complex overlay has been converted to Xerox .FRM format, resulting in more data than the standard allows.
- System response: Document processing continues. The .FRM will be merged with the page data and not be downloaded and referenced as a .FRM.
- User action: Optimize the overlay referenced to reduce its complexity.

**XAM6281F FATAL ERROR ENCOUNTERED BY *module name* DURING *table* BUILD PROCESSING. MAXIMUM NUMBER OF *value* ENTRIES EXCEEDED FOR OVERLAY RESOURCE NAMED *form member name* (M). IC=X'address'**

- Explanation: This is an internal error. The overlay is too complex to be processed.
- System response: The overlay cannot be converted to a Xerox form. Document processing is terminated. The document remains in the output queue.
- User action: Call Xerox Technical Support.

**XAM6282F FATAL ERROR ENCOUNTERED BY *module name* DURING STORAGE INITIALIZATION PROCESSING. STORAGE ACQUIRED OF X'acquired storage size' BYTES DOES NOT MATCH STORAGE ALLOCATED OF X'calculated storage size' BYTES. IC=X'acquired storage address'**

- Explanation: This is an internal error.
- System response: The overlay cannot be converted to a Xerox form. Document processing is terminated. The document remains in the output queue.
- User action: Call Xerox Technical Support.

**XAM6283F FATAL ERROR ENCOUNTERED BY *module name* DURING *draw rule metacode data table* BUILD PROCESSING. *element* DOES NOT SPECIFY *parameter* AS REQUIRED FOR OVERLAY RESOURCE NAMED *form member name* (M). IX=X'address'**

- Explanation: This is an internal error.
- System response: The overlay cannot be converted to a Xerox form. Document processing is terminated. The document remains in the output queue.
- User action: Call Xerox Technical Support.

**XAM6284F**    **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *element* **BUILD PROCESSING. METACODE TEXT DATE LENGTH IS LESS THAN 1 OR GREATER THAN 256 FOR OVERLAY RESOURCE NAMED** *form member name (M)*. **IC=X'address'**

Explanation:    This is an internal error.

System response:    The overlay cannot be converted to a Xerox form. Document processing is terminated. The document remains in the output queue.

User action:    Call Xerox Technical Support.

**XAM6285F**    **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *element* **BUILD PROCESSING. INSUFFICIENT SPACE AVAILABLE TO CONTAIN** *image count* **GHO PACKET ENTRIES FOR OVERLAY RESOURCE NAMED** *form member name (M)*. **IC='address'**

Explanation:    This is an internal error.

System response:    The overlay cannot be converted to a Xerox form. Document processing is terminated. The document remains in the output queue.

User action:    Call Xerox Technical Support.

**XAM6307E**    **MINOR ERROR ENCOUNTERED BY** *module name* **DURING** *command LDM* *ldm command description* **PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO** *command* **FILE DDNAME** *form library ddname* **FOR** *overlay* **RESOURCE NAMED** *form member name (form orientation)*

Explanation:    This is an internal error.

System response:    The conversion of the overlay to a Xerox form is not directly affected by this error. If *command* is FLCA, the preceding allocation failure may affect the final outcome of the document.

User action:    Call Xerox Technical Support.

**XAM6308E**    **SEVERE ERROR ENCOUNTERED BY** *module name* **DURING** *command LDM* *ldm command description* **PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO** *command* **FILE DDNAME** *form library ddname*, **FOR** *overlay* **RESOURCE NAMED** *form member name (form orientation)*

Explanation:    This is an internal error.

System response:    The conversion of the overlay to a Xerox form is not directly affected by this error. However, the converted form could not be successfully written to the output form library. The final outcome of the document is at the discretion of the component or subcomponent that invoked XAMFRM.

User action:    Call Xerox Technical Support. If the error message indicates that the system could not allocate the file, complete these steps:

- Verify that the native form library exists as specified in the XOSF start-up proc.
- Ensure that sufficient library space is available.

**XAM6319F** **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *type of processing* **BUFFER STORAGE MANAGEMENT PROCESSING. RC=X'return code'; IC=X'buffer control block address'. UNABLE TO** *activity type* **DATA BUFFER, FOR OVERLAY RESOURCE NAMED** *form member name* **(M)**

Explanation: This is an internal error.

System response: The overlay cannot be converted to a Xerox form. Document processing is terminated. The document remains in the output queue.

User action: Call Xerox Technical Support.

**XAM7600E** *module name* **ERROR PROCESSING AEG**

Explanation: The end-of-page processor invokes XRFAEG to rebuild the active environment group in case any page segments included in the overlay contain text. XRFAEG was unable to complete its processing normally.

System response: Document processing is terminated.

User action: This message is preceded by a message from XRFAEG. Refer to that message for the appropriate action. The probable cause of the error is a missing font. Ensure the font tables contained in the font table library correctly reflect the fonts contained in the IBM font libraries used by SCRIPT.

**XAM7601F** **OVERLAY PAGE SEGMENT CONSOLIDATION FAILED. SEE LOG FOR DETAILS.**

Explanation: An error was detected when attempting to convert an IBM AFP Overlay, which contains references to more than 16 images, to a Xerox form (.FRM). XOSF will attempt to consolidate all the images used in the Xerox form into a single image. Refer to the XOSFLOG for other message that indicate the cause of the failure.

System response: The overlay to form conversion is terminated and the document is aborted.

User action: Attempt to resolve the other errors reported in the XOSFLOG. If that does not resolve the problem, contact Xerox Technical support.

**XAM7656W** *resource type resource name* **IMAGE POSITION** (*vpos,hpos*) **IS OUTSIDE THE PHYSICAL PAGE BOUNDARY AND WILL NOT BE PRINTED**

Explanation: While processing an image within AFP resource *resource name* of type *resource type*, XOSF calculated a position that would place the image outside the physical page. *Vpos* and *hpos* are the vertical and horizontal positions in dots, relative to the Xerox page origin.

System response: Document processing continues, but the image is not printed.

User action: Ensure that the entire image fits within the physical page boundary for the paper size you are using. If the problem persists, call Xerox Technical Support.

**XAM7657E ONE OR MORE *record types* WERE SPECIFIED TO PRINT OUTSIDE THE VALID PRINTABLE AREA FOR *area***

Explanation: You specified either UNBLOCK or BLKCHAR in the DATAACK IBM JCL keyword. The specified data type was detected outside of the valid printable area (the lesser of the logical and physical page boundaries). Text strings and rules have been truncated at the point at which they exceed the valid printable area. Inline and page segment images are not printed if any part of them is outside the valid printable area. Error indicators on the page in question highlight the point at which the data check occurred. When data checks have been detected for an overlay during conversion, the error message and error indicators relating to the page on which the converted overlay first appears is issued only once.

System response: Document processing continues.

User action: Refer to messages XAM7658E and XAM7659E for the page number, page side, and active environment details to determine the exact location of the errors. Ensure the correct medium map, data map, and paper size are in effect. If correct, check the logical page size, the coordinates and orientation of the data in error, the font size, and any other aspects of the page.

**XAM7658E THE ABOVE ERRORS OCCURRED ON THE *page side* OF PAGE *page number***

Explanation: You specified either UNBLOCK or BLKCHAR in the DATAACK IBM JCL keyword. Data-off-page conditions were detected on the specified side of the specified page within the document. Page counting starts with and includes separator pages. Error indicators on the page in question highlight the point at which the data check occurred.

System response: Document processing continues.

User action: Refer to messages XAM7657E and XAM7659E for the data types and the active environment details to determine the exact nature of the errors. Ensure the correct medium map, data map, and paper size are in effect. If correct, check the logical page size, the coordinates and orientation of the data in error, the font size, and any other aspects of the page.

**XAM7659E MEDIUM MAP *medium map name* AND DATA MAP *data map name* WERE ACTIVE WHEN THE ERRORS WERE DETECTED**

Explanation: You specified either UNBLOCK or BLKCHAR in the DATAACK IBM JCL keyword. Data-off-page conditions were detected on a page using the specified medium map and data maps. Error indicators on the page in question highlight the point at which the data check occurred.

System response: Document processing continues.

User action: Refer to messages XAM7657E and XAM7658E for the data types, page number, and page side to determine the exact nature and location of the errors. Ensure that the correct medium map, data map, and paper size are in effect. If correct, check the logical page size, the coordinates and orientation of the data in error, the font size, and any other aspects of the page.

**XAM9440E ABEND IN** *module name* **SNAP DUMP ID=***dump id*

Explanation: This is an internal error.  
 System response: Document processing is terminated.  
 User action: Call Xerox Technical Support.

**XAM9441E ABEND CODE: SYSTEM=***system code*, **USER=***user code*

Explanation: This is an internal error.  
 System response: Document processing is terminated.  
 User action: Call Xerox Technical Support.

**XAM9442E REGISTERS** *registers xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx*  
*xxxxxxx*

Explanation: This message accompanies XAM9441E to provide additional diagnostic information.  
 System response: Document processing is terminated.  
 User action: Call Xerox Technical Support.

**XAM9443E NEXT INSTRUCTION IS:** *instruction*

Explanation: This message accompanies XAM9441E to provide additional diagnostic information.  
 System response: Document processing is terminated.  
 User action: Call Xerox Technical Support.

**XAM9444E INVALID BIN NUMBER** *bin number* **IN FORMDEF** *formdef name*. **DEFAULT VALUE ASSIGNED**

Explanation: XPAF encountered a reference to a bin number in the named FORMDEF which has no corresponding entry in the varying paper size table.  
 System response: Document processing continues. The default bin number and paper size are used.  
 User action: Modify the named FORMDEF or add an entry to the varying paper size table for the bin number.

**XAM9445E ERROR PROCESSING THM** *command*. **PROCESSING** *table*

Explanation: An error occurred while attempting to initialize one of the paper-related tables. The error occurred while processing the identified command on the specified table. This message is preceded by additional messages from THM that identify the exact cause of the problem.  
 System response: Processing continues, but AFP varying paper size support is disabled.  
 User action: To reenale AFP varying paper size support, correct the problem identified by the THM messages. Then, restart the printer.

**XAM9446E      COULD NOT ACQUIRE TCB, THM RC=***return code*

Explanation:      An error occurred while attempting to initialize one of the paper-related tables. This message is preceded by additional messages from THM that identify the exact cause of the problem.

System response:      Processing continues, but AFP varying paper size support is disabled.

User action:      To reenale AFP varying paper size support, correct the problem identified by the THM messages. Then, restart the printer.

**XAM9448F      UNSUPPORTED *object* STRUCTURED FIELD TYPE**

Explanation:      An unsupported record was detected in the data stream. XPAF does not support this resource type.

System response:      The document is aborted.

User action:      Remove the unsupported records to print document.

## XAU messages

---

**XAU0305E**     **COULD NOT** *activity* **TABLE** *table name* *operation*. **THM RC=X** '*return code*'

Explanation:     An attempt to process the indicated table failed. *Operation* identifies the type of processing that was being performed when the error occurred.

System response:     Command processing is terminated.

User action:     Call Xerox Technical Support.

**XAU2134E**     **PREMATURE END OF FILE READING** *resource type for conversion* **IN** *resource name, library dataset name/native library name*

Explanation:     A premature end-of-file condition was encountered when reading the named resource from the named resource library. This error may indicate that the resource name is invalid.

System response:     Resource conversion is terminated.

User action:     Make sure the named resource is valid. If the problem persists, call Xerox Technical Support.

**XAU3010F**     **COULD NOT GET X'amount' **BYTES OF MEMORY** *activity***

Explanation:     Insufficient storage was available for the conversion program to obtain the requested amount for the required data buffer.

System response:     Resource conversion cannot be completed successfully. Document processing is terminated.

User action:     Increase the region size allocated to the XOSF start-up proc or drain another printer and retransmit the document. If the problem persists, call Xerox Technical Support.

**XAU3011E**     **COULD NOT RELEASE X'amount' **BYTES OF MEMORY FROM LOCATION X'address'*activity*****

Explanation:     This is an internal error. The storage used for conversion program processing was not released, and the document may be incorrect.

System response:     Document processing continues.

User action:     Call Xerox Technical Support.

**XAU3018E**     **COULD NOT ACQUIRE TCB** *activity*. **THM RC=X**'*return code*'

Explanation:     This is an internal error.

System response:     XOSF processing is terminated.

User action:     Call Xerox Technical Support.

**XAU3725F    INVALID PIPELINE REQUEST:** *invalid request*

Explanation:    This is an internal error.  
 System response:    XOSF processing is terminated.  
 User action:    Call Xerox Technical Support.

**XAU4004F    *module name* DETECTED AN INVALID *control block name* CONTROL BLOCK AT LOCATION X 'address'**

Explanation:    This is an internal error.  
 System response:    XOSF processing is terminated. The address space remains active.  
 User action:    Call Xerox Technical Support.

**XAU4006E    COULD NOT FIND *table type* TABLE. THM IC=X'*information code*'; RC=X'*return code*'**

Explanation:    This is an internal error.  
 System response:    XOSF processing is terminated.  
 User action:    Call Xerox Technical Support.

**XAU4023E    PAPERSIZ=*paper size parameter* IS INVALID. LETTER ASSUMED**

Explanation:    An invalid paper size value was specified in one of these parameters/keywords:

- Initialization parameter
- Printer profile parameter
- Extended JCL keyword

System response:    Processing continues using 8.5 by 11 inch (LETTER) paper size.

User action:    Correct the *paper size parameter* by entering a user-defined name that matches an entry in the currently active paper name table or one of these values:

|     |    |       |        |        |
|-----|----|-------|--------|--------|
| #7  | A5 | C5    | LEGL13 | STATMT |
| #10 | A6 | DL    | LETTER |        |
| A3  | B4 | EXEC  | LONG   |        |
| A4  | B5 | LEGAL | POST   |        |

**XAU4110E    THE BUFFER MANAGER REPORTED AN ERROR TO MODULE *module name*. RC=X'*return code*'**

Explanation:    This is an internal error.  
 System response:    Document processing is terminated.  
 User action:    Call Xerox Technical Support.

**XAU414FE**    *buffer name* **BUFFER CAPACITY EXCEEDED**

- Explanation: While trying to add another text record for the current page, the document fragment buffer was found to be full. The buffer contains a page that is too complex for decentralized printing.
- System response: Document processing is terminated, and the document is requeued.
- User action: Try to reduce the complexity of the page, or send the output to a centralized printer.

**XAU4212E**    *FRM name* **CONTAINS UNSUPPORTED EXTENDED TEXT LINE INFORMATION. FRM CONVERSION IS TERMINATED**

- Explanation: The form header contains extended text line format data indicating that the centralized form uses double-byte fonts. These are not supported on decentralized printers.
- System response: Form conversion is terminated, document processing halts, the job is requeued, and output is held.
- User action: Choose one of these options:
- Print the job on a centralized printer.
  - Print the job on a decentralized printer, either by recreating the form using standard fonts, or by removing the form from the page format.

**XAU4213E**    *FRM name* **CONTAINS UNSUPPORTED DOUBLE-BYTE FONTS. FRM CONVERSION IS TERMINATED**

- Explanation: The font list in the centralized form contains double-byte fonts, which are not supported on decentralized printers.
- System response: Form conversion is terminated, document processing halts, the job is requeued, and output is held.
- User action: Choose one of these options:
- Print the job on a centralized printer.
  - Print the job on a decentralized printer, either by recreating the form using standard fonts, or by removing the form from the page format.

**XAU4214E    FRM *name* CONTAINS UNSUPPORTED 600 DPI COMMANDS. FRM CONVERSION IS TERMINATED**

- Explanation:    The centralized form conversion encountered data which indicates that the form was created for a 600-dpi device. 600-dpi forms cannot be converted for use on a decentralized printer.
- System response:    Form conversion is terminated, document processing halts, the job is requeued, and output is held.
- User action:    Choose one of these options:
- On the FORMLIB DD statement, specify a library that contains centralized 300 dpi forms. If there is no such library, create one by recompiling the forms using 300-dpi fonts and font width tables.
  - Print the job on a centralized printer.
  - Print the job on a decentralized printer, either by recreating the form using standard fonts, or by removing the form from the page format.

**XAU4301W    X'*unsupported control character*' IS NOT A SUPPORTED *control type* CONTROL CHARACTER. SPACE 1 LINE IS ASSUMED**

- Explanation:    The supplied carriage control character was not found in the list of supported controls for the indicated control type.
- System response:    Processing continues with single spacing for the current record.
- User action:    Determine the cause of the problem and correct it. The problem may be caused by:
- Specifying ASA controls with RECFM=FBM
  - Specifying machine controls with RECFM=FBA
  - Specifying no controls with RECFM=FBM or FBA

**XAU4302W    X'*control character*' IS A RESERVED MACHINE CONTROL CHARACTER. DATA RECORD NOT PRINTED**

- Explanation:    Certain machine carriage control codes are reserved for printers. Printers ignore these codes and produce no output.
- System response:    Document processing continues.
- User action:    Correct the data stream to use only valid output control commands. Reserved machine control codes are 02, 03, 04, 05, 06, 07, 0A, 12, 23, 43, 63, 6B, EB, FB, and F3.

**XAU4303W SKIP TO CHANNEL** *channel number* **NOT SUPPORTED IN DATA MAP** *data map name*.  
**SPACE 1 LINE IS ASSUMED**

- Explanation: The conversion program searched all Line Descriptor records for the channel number specified in the carriage control character but did not find it in the current data map.
- System response: Document processing continues.
- User action: If the channel is specified in the named data map, call Xerox Technical Support. Otherwise, use one of these solutions:
- Insert an IDM structured field that names the correct data map into the data stream.
  - Modify the data map so it supports the specified channel.
  - Change the data so that it does not call for that channel.

**XAU4310E UNABLE TO PRINT VARIABLE DATA USING MEDIUM MAP** *map name* **IN FORMDEF**  
*formdef name* **DUE TO CONSTANT FORM SPECIFICATION.** *document status*

- Explanation: The conversion program has determined that the document contains variable data to be printed using the named medium map and FORMDEF. However, the medium map calls for one of two specifications that do not permit variable data:
- Constant forms on both sides in a duplex job
  - Constant forms on the front of a simplex job
- System response: Document processing is terminated.
- User action: These are two alternatives:
- Remove CONSTANT BOTH (for duplex jobs) or CONSTANT FRONT (for simplex jobs) from the medium map.
  - Use an IMM structured field to change medium maps before the variable data.
- If the problem persists, call Xerox Technical Support.

**XAU4328F ERROR DETECTED PROCESSING** *resource type resource member name* **IN** *document part*  
OR

**ERROR DETECTED PROCESSING INLINE PAGEDEF/FORMDEF** *document part*

- Explanation: The resource processor detected an error in the input data stream while trying to convert an IBM AFP resource. The resource member name is displayed without its 2-character prefix. For example, a page segment named S1SAMP is identified in the message as SAMP. The *document*

*part* is either DOCUMENT, AFPJOBHDR, AFPJOBTLR, AFPMSGDS or AFPDSHDR, referring to either the document itself or one of the AFP banner types.

System response: In most cases, document processing is terminated. If the resource is an inline PAGEDEF or FORMDEF, document processing may continue using the default values. If document processing is terminated, the document remains in the output queue.

User action: Examine the system log for any related messages issued by XRF. If the named resource is a page segment, check the printed output to verify correct text positioning. If processing is terminated, make sure the resource is called by a valid name in the data stream. Try to correct the problem and rerun the job. If the problem persists, call Xerox Technical Support.

**XAU4329E REQUESTED *map type map name* NOT FOUND IN *resource type resource name***

Explanation: While processing a page format or an IDM structured field, the transform could not find the named copy modification, page layout, or data map in the named resource.

System response: Document processing is terminated.

User action: Make sure the required page format or PAGEDEF is present in the resource library. If resource libraries are concatenated, make sure the resource in error is stored in the first library in the chain. If not:

- Delete or rename any earlier libraries with resources of the same name, then use the XPAF operator command to refresh the resource directory.
- Rearrange the datasets in the concatenation to place the desired library at the head of the chain.

**XAU4330E CONDITIONAL PROCESSING CONTROL ID *id* NOT FOUND IN PAGEDEF *pagedef name***

Explanation: While processing the line controls within a PAGEDEF or page format for a page-formatted or AFP job, XPAF encountered a reference to a conditional processing test that was not included in the PAGEDEF or page format.

System response: Document processing is terminated.

User action: Locate a corrected copy of the PAGEDEF or page format, load it into your PDEFLIB, refresh the library directory, then resubmit the job.

**XAU4331E INVALID INLINE *resource type* STRUCTURED FIELD IS X'*structured field id*'**

Explanation: While processing an inline PAGEDEF or FORMDEF, the reported structured field was encountered. This field is not valid within this resource.

System response: Document processing is terminated.

User action: Correct the specified inline resource and resubmit the job.

**XAU4333W    INVALID STRUCTURED FIELD ID X'*structured field id*' FOUND. CHECK OUTPUT FORMATTING**

Explanation:    A 5A input record contained the named invalid structured field ID.

System response:    Document processing continues without processing the 5A record.

User action:    Check the output format for correctness. Make sure the structured field ID is valid and the introducer length is correct.

**XAU4334E    PRESENTATION TEXT CONTROL LENGTH OR CHAINING ERROR ENCOUNTERED**

Explanation:    During processing of an AFP presentation text (PTX) block, an invalid PTX control chain or sequence has been encountered.

System response:    The remainder of the PTX block is ignored, but processing of the page or resource continues.

User action:    Check the PTX controls and freestanding text records for invalid chaining, sequence, or length errors. If the error occurs within an overlay, once corrected, the overlay should be revised via the REVOVLY extended JCL keyword.

**XAU4336E    UNSUPPORTED CTX CONTROL ENCOUNTERED: *ctx\_control***

Explanation:    During processing of an AFP composed text (CTX) block, an unsupported triplet was encountered.

System response:    The unsupported CTX triplet is ignored, processing of the remainder of the CTX block continues.

User action:    Check the CTX block and remove the unsupported triplet(s).

**XAU4337W    UNSUPPORTED PTX SEC COLOR SPACE ENCOUNTERED: *xx***

Explanation:    While converting an AFP document a PTX structured field was encountered that contained a Set Extended Color triplet that called for a color space that is not recognized.

System response:    The SEC triplet is ignored and the color is not changed.

User action:    Check the AFP data stream to make sure the color space is valid. If so, contact Xerox Technical Support.

**XAU4338W    PTX SEC *cspace* COLOR SPACE IS NOT SUPPORTED AND IS IGNORED**

Explanation:    While converting an AFP document a PTX structured field was encountered that contained a Set Extended Color triplet that referred to a color space that is not supported.

System response:    The SEC triplet is ignored and the color is not changed.

User action:    Check the AFP data stream to make sure the color space is valid. If so, contact Xerox Technical Support.

**XAU4354E    CHECKPOINT (#CKPT) FAILED IN MODULE *module name*. RC=X'return code'**

Explanation:    An error was returned by the operating system when XPAF tried to determine if a document had reached the threshold for taking a checkpoint.

System response:    Document processing is terminated.

User action:    Verify that there is not a problem with your job entry subsystem or with the document as stored by the operating system. If the problem persists, call Xerox Technical Support.

**XAU4155W    MEMBER *memname* WAS NOT FOUND IN THE AFP TRIGGER LIBRARY. THE DOCUMENT WILL NOT BE SPLIT.**

Explanation:    A printer that has the splitting feature enabled, FEATURE=SPLITDOC, cannot find the AFP trigger file when processing an AFP document.

System response:    Processing continues. The document will not be split.

User action:    Create a trigger file with the specified mename in the AFP trigger dataset, or use the XSPLTMEM extended JCL keyword to specify an existing trigger file.

**XAU4156W    UNABLE TO OPEN THE AFP TRIGGER LIBRARY. THE DOCUMENT WILL NOT BE SPLIT.**

Explanation:    A printer that has the splitting feature enabled, FEATURE=SPLITDOC, cannot open the AFP trigger library, referenced by the TRIGGERA DD JCL statement.

System response:    Processing continues. The document will not be split.

User action:    Check to make sure the XOSF Started Task has the AFP trigger library allocated using the TRIGGERA DD statement.

**XAU530FE    ENTRY *font* NOT FOUND IN XPAFAFW. THM IC='code'**

Explanation:    The fetch process failed when processing the XPAFAFW table for a replica font.

System response:    Document processing is terminated.

This error usually indicates an error with font installation to the native libraries. If you have recently installed new or updated fonts, review the procedure for resource installation in [Section Two: Installing and Customizing XPAF](#).

User action:    to determine if the steps were completed correctly. If the problem persists, call Xerox Technical Support.

**XAU6307E**    **MINOR ERROR ENCOUNTERED BY** *module name* **DURING** *command* **LDM** *ldm command description* **PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO** *command* **FILE DDNAME** *form library ddname*, **FOR** *frm* **RESOURCE NAMED** *resource member name (form orientation)*

Explanation:    This is an internal error.

System response:    Conversion of the form to XES format is not directly affected by this error. Other related messages may provide more information about this error.

User action:    Call Xerox Technical Support.

**XAU6309F**    **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *processing operation* **LDM** *ldm processing operation description* **PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO** *activity* **FILE DDNAME** *library ddname* **FOR** *resource type* **RESOURCE NAMED** *resource member name (transform type)*

Explanation:    This may be an internal error. If it is an allocation error, the library specified by *library ddname* could not be allocated using LDM.

System response:    Document processing is terminated, and the document remains in the output queue.

User action:    Ensure that the requested resource has been loaded into the named library. If it is an allocation error, verify that the named library exists. If the problem persists, call Xerox Technical Support.

**XAU6317E**    **MINOR ERROR ENCOUNTERED BY** *module name* **DURING** *activity* **BUFFER STORAGE MANAGEMENT PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO** *activity type* **DATA BUFFER FOR** *type* **RESOURCE NAMED** *resource member name (transform type)*

Explanation:    This is an internal error.

System response:    Conversion of the form to XES format is not directly affected by this error. Other related messages may provide more information about this error.

User action:    Call Xerox Technical Support.

**XAU6319F**    **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *type of processing* **BUFFER STORAGE MANAGEMENT PROCESSING. RC=X'return code'; IC=X'buffer control block address'. UNABLE TO** *activity type* **DATA BUFFER FOR** *frm* **RESOURCE NAMED** *resource member name (M)*

Explanation:    This is an internal error.

System response:    The form cannot be converted to XES format. Document processing is terminated. The document remains in the output queue.

User action:    Call Xerox Technical Support.

**XAU6404E**    **RECORD EXCEEDS FRAGMENT SIZE. DATA LOSS IS EXPECTED**

Explanation:    This is an internal error.

System response:    The record is discarded and processing continues.

User action:    Call Xerox Technical Support.

**XAU6413E IMAGE *image name* CANNOT BE ACCESSED IN SUPPLIED LIBRARIES**

Explanation: The indicated image could not be found in either the primary or secondary library.

System response: The requested image is ignored and processing continues.

User action: Supply the image in the correct library as named in the printer's profile.

**XAU6501E THM FETCH FAILURE. MODULE *module name* WAS UNABLE TO RETRIEVE *resource name* FROM TABLE *table name*. IC=X'*information code*'**

Explanation: While attempting to retrieve the named resource from the named table, the transform encountered a THM FETCH error. XOSF may have been trying to retrieve a font found in a form header from the XPAFXFI table. The XPAFXFI table entry is based on the code page name and the font name.

System response: Processing is terminated.

User action: Make sure the font metric conversion job completed successfully. For more information about this job, refer to [Section Three: Managing Resources with XPAF](#). If the conversion completed successfully, call Xerox Technical Support.

For page-formatted documents, in XOAF ensure that you have run the Update Xerox Font Characteristics Information option on the Xerox Page Format Editor menu. For more information on using the page format editor, refer to [Section Eight: Xerox Page Format Editor User Guide](#).

**XAU7600E *module name* ERROR PROCESSING AEG**

Explanation: This is an internal error.

System response: Document processing is terminated.

User action: Call Xerox Technical Support.

**XAU7653E TEXT RECORD WITH ZERO LENGTH ENCOUNTERED. OUTPUT MAY BE CORRUPTED**

Explanation: During the processing of text and shading information for printing an AFP document on decentralized printers, XPAF encountered a zero length record where one was not expected.

System response: Document processing continues.

User action: This is often a problem with the document itself. Verify the validity of the document being printed, including any resources used (especially overlays). If you believe you are receiving this message with a valid document, call Xerox Technical Support.

**XAU7654W *nn record type* RECORDS FOR SIDE *side number* WERE REJECTED HAVING STARTING COORDINATES OFF PAGE**

Explanation: While processing a record, a negative coordinate or a coordinate beyond the physical page was encountered but not sent.

- *nn* is the number of records rejected.

- *record type* describes the type of record rejected (such as RULE, TEXT, or IMAGE).
- *side number* names the page number on which the error occurred.

System response: Page printing continues.

User action: Check the offset in the FORMDEF or in the IPS structured fields. Check the printed output to locate the problem records, and adjust the parameters and the page offset to correct the printing position.

**XAU7657E ONE OR MORE *record types* WERE SPECIFIED TO PRINT OUTSIDE THE VALID PRINTABLE AREA FOR *area***

Explanation: You specified either UNBLOCK or BLKCHAR in the DATA IBM JCL keyword. The specified data type was detected outside of the valid printable area (the lesser of the logical and physical page boundaries). Text strings and rules have been truncated at the point at which they exceed the valid printable area. Inline and page segment images are not printed if any part of them is outside the valid printable area. Error indicators on the page in question highlight the point at which the data check occurred. When data checks have been detected for an overlay during conversion, the error message and error indicators relating to the page on which the converted overlay first appears are issued only once.

System response: Document processing continues.

User action: Refer to messages XAU7658E and XAU7659E for the page number, page side, and active environment details to determine the exact location of the errors. Ensure the correct medium map, data map, and paper size are in effect. If correct, check the logical page size, the coordinates and orientation of the data in error, the font size, and any other aspects of the page.

**XAU7658E THE ABOVE ERRORS OCCURRED ON THE *page side* OF PAGE *page number***

Explanation: You specified either UNBLOCK or BLKCHAR in the DATA IBM JCL keyword. Data-off-page conditions were detected on the specified side of the specified page within the document. Page counting starts with and includes separator pages. Error indicators on the page in question highlight the point at which the data check occurred.

System response: Document processing continues.

User action: Refer to messages XAU7657E and XAU7659E for the data types and the active environment details to determine the exact nature of the errors. Ensure the correct medium map, data map, and paper size are in effect. If correct, check the logical page size, the coordinates and orientation of the data in error, the font size, and any other aspects of the page.

**XAU7659E MEDIUM MAP *medium map name* AND DATA MAP *data map name* WERE ACTIVE WHEN THE ERRORS WERE DETECTED**

Explanation: You specified either UNBLOCK or BLKCHAR in the DATAACK IBM JCL keyword. Data-off-page conditions were detected on a page using the specified medium map and data maps. Error indicators on the page in question highlight the point at which the data check occurred.

System response: Document processing continues.

User action: Refer to messages XAU7657E and XAU7658E for the data types, page number, and page side to determine the exact nature and location of the errors. Ensure the correct medium map, data map, and paper size are in effect. If correct, check the logical page size, the coordinates and orientation of the data in error, the font size, and any other aspects of the page.

**XAU9440E ABEND IN *module name* SNAP DUMP ID=*dump id***

Explanation: This is an internal error.

System response: Document processing is terminated and the XOSF address space remains active.

User action: Call Xerox Technical Support.

**XAU9441E ABEND CODE: SYSTEM=*system code*, USER=*user code***

Explanation: This is an internal error.

System response: Processing continues.

User action: Call Xerox Technical Support.

**XAU9442E REGISTERS *registers* xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx**

Explanation: This message accompanies XAU9441E to provide additional diagnostic information.

System response: Processing continues.

User action: Call Xerox Technical Support.

**XAU9443E NEXT INSTRUCTION IS: *instruction***

Explanation: This message accompanies XAU9441E to provide additional diagnostic information.

System response: XOSF processing continues.

User action: Call Xerox Technical Support.

**XAU9444E    INVALID BIN NUMBER *bin number* IN FORMDEF *formdef name*. DEFAULT VALUE ASSIGNED**

- Explanation:    XPAF encountered a reference to a bin number in the named FORMDEF which has no corresponding entry in the varying paper size table.
- System response:    Document processing continues. The default bin number and paper size are used.
- User action:    Modify the named FORMDEF or add an entry to the varying paper size table for the bin number.

**XAU9445E    ERROR PROCESSING THM *command*. PROCESSING *table***

- Explanation:    An error occurred while attempting to initialize one of the paper-related tables. The error occurred while processing the identified command on the specified table. This message is preceded by additional messages from THM that identify the exact cause of the problem.
- System response:    Processing continues, but AFP varying paper size support is disabled.
- User action:    To reenale AFP varying paper size support, correct the problem identified by the THM messages. Then, restart the printer.

**XAU9446E    COULD NOT ACQUIRE TCB, THM RC=*return code***

- Explanation:    An error occurred while attempting to initialize one of the paper-related tables. This message is preceded by additional messages from THM that identify the exact cause of the problem.
- System response:    Processing continues, but AFP varying paper size support is disabled.
- User action:    To reenale AFP varying paper size support, correct the problem identified by the THM messages. Then, restart the printer.

**XAU9447W    COLOR OUTPUT IN FORM *form name* HAS BEEN DISCARDED**

- Explanation:    The color centralized form being converted to a decentralized form contains color ink resources, which are not supported on decentralized printers.
- System response:    Processing continues, but output consists of .FNT and .IMG data only. Any data using .INK resources is not printed.
- User action:    If you have a decentralized printer that supports color (for example, the 4700 printer), submit the job to that printer. Otherwise, you may wish to remove the color ink resources from the form.

**XAU9448F    UNSUPPORTED *object* STRUCTURED FIELD TYPE**

- Explanation:    An unsupported record was detected in the data stream. XPAF does not support this resource type.
- System response:    The document is aborted.
- User action:    Remove the unsupported records to print document

## XCC messages

---

**XCC0203E**    **THM ERROR IN MODULE** *module name*. **CMD=***thm command*; **IC=X'***thm-information code*'; **RC=X'***thm-return code*'

Explanation:    While attempting to process an XPAF VSAM dataset, an unexpected error was encountered. Other messages are usually issued along with this message to further identify the operation that failed.

System response:    The current operation is terminated.

User action:    Verify that all of the required XPAF libraries are present and not corrupted. If you believe you are receiving this message in error, call Xerox Technical Support.

**XCC1101W**    *invalid channel number/invalid line number=number. assign=(values)*

Explanation:    The ASSIGN keyword specified in either the PDL or the data stream contains an invalid channel number or line number. The message identifies the number in error, and the values you specified for the ASSIGN keyword.

System response:    XOSF processing continues. Additional messages will be generated by the printer. The document may be terminated at the printer, or printed incorrectly.

User action:    Correct the invalid channel number or line number.

- The channel number must be a number from 1 to 12.
- The line number must be a decimal number between 1 and 255, inclusive.

If you specified the ASSIGN keyword in the PDL, be sure to correct it on the printer and also in the native PDL library on the host.

**XCC1222F**    *#varblk in xccmain detected error on get*

Explanation:    This is an internal error.

System response:    Document processing is terminated.

User action:    Call Xerox Technical Support.

**XCC3010F**    **COULD NOT GET X'***amount***' BYTES OF MEMORY** *activity*

Explanation:    This is an internal error.

System response:    Processing continues.

User action:    Run the job using a larger region size. If the problem persists, call Xerox Technical Support.

**XCC3011E**     **COULD NOT RELEASE X'*amount*' BYTES OF MEMORY FROM LOCATION X'*location*'  
*name***

Explanation:     This is an internal error.

System response:     Document processing is terminated. The XOSF address space remains active.

User action:     Call Xerox Technical Support.

**XCC3016E**     **COULD NOT *operation* MEMBER *member name* OF LIBRARY *dataset name* FOR MODULE  
XCCPTerm. LDM RC=X'*return code*'**

Explanation:     XPAF could not perform the named operation on the specified member.

System response:     Document processing continues.

User action:     Ensure the member exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XCC4003E**     **FRAGMENT SIZE X'*fragment size*' DOES NOT AGREE WITH EXPECTED SIZE X'*expected*  
*fragment size*' activity**

Explanation:     This is an internal error.

System response:     Document processing is terminated.

User action:     Call Xerox Technical Support.

**XCC4404E**     **NO LINE NUMBERS FOR ASSIGN DJDE KEYWORD**

Explanation:     The DJDE or PDL contains an invalid ASSIGN keyword.

System response:     Document processing continues, but the keyword is ignored.

User action:     Correct the invalid keyword, and resubmit the job.

**XCC4405E**     **INVALID REFERENCE MEMBER PRIORITY=*priority***

Explanation:     This is an internal error. To determine the processing hierarchy for DJDE and PDL keywords, XOSF assigns each keyword a priority based on that keyword's origin. While processing this document, XOSF detected an invalid priority.

System response:     Document processing is terminated. The job is requeued and held in the JES queue.

User action:     Call Xerox Technical Support.

**XCC6102W**    *resource type* **TABLE FULL.** *resource name* **NOT PROCESSED**

- Explanation:    The *resource name* could not be added to the internal table for that *resource type*.
- System response:    The named resource will not be processed for resource management and may not be downloaded to the centralized printer for this job.
- User action:    Run a job referencing the resource by itself to ensure XOSF will download the resource if required. Then, rerun the original job to ensure that it prints with the current version of the resource.

**XCC6104E**    *member name* **NOT FOUND IN** *ddname* **PDL LIBRARY. PROCESSING INCOMPLETE**

- Explanation:    The named member could not be located in the native library associated with the DD name identified in the message.
- System response:    Processing continues without the missing member.
- User action:    Perform these steps:
- Verify that you specified the correct member name in the data stream and/or JCL for the job.
  - Use the PDL loader to load the PDL into the library associated with the DD name identified in this message.

**XCC6105I**    *file name* **NOT FOUND IN** *library name* **LIBRARY. DOWNLOADING** *file name*

- Explanation:    The PDL object member with a version number matching the printer's LPSRELEASE was not found in the PDLLIB, another version was found.
- System response:    The object file with the version number indicated in the message is downloaded to the printer. This message is only issued if intensive logging is turned on.
- User action:    If an object file with the matching version number exists it must be loaded into the PDLLIB with the PDL loader using the correct version number.

**XCC6404E**    **RECORD EXCEEDS FRAGMENT SIZE. DATA LOSS IS EXPECTED**

- Explanation:    An input data record has exceeded the size of the output fragment. The output fragment is at least 512 bytes.
- System response:    Processing continues. The input record is truncated to the size of the output data block size.
- User action:    Ensure that the data being printed has a record length of 512 bytes or less. If the problem persists, call Xerox Technical Support.

**XCC6417F**     **RESOURCE** *resource member name*, **TYPE** *resource type* **FAILED EXIT 6**  
**AUTHORIZATION**

Explanation:     The current user exit 06 has instructed XPAF to not allow the user to access this particular resource.

System response:     The current print job is aborted.

User action:     Contact your system programmer for information on the operation of user exit 06 at your site.

**XCC6422I**     *printer name activity* **TO PAGE** *page number*

Explanation:     The printer has performed the specified *activity*. *Activity* indicates a JES command to forward space or backspace to a specified *page number*.

System response:     Processing continues.

User action:     None required.

## XCD messages

---

**XCD0221E**     *option* **FAILED. TABLE** *table name* **NOT FOUND IN DDNAME** *table library ddname*

Explanation:     The failed option was attempted for the specified table, but the table name could not be found in the dataset associated with the specified DD name.

System response:     Document processing is terminated. The document is requeued to hold status.

User action:     Correct the table name or the DD name, and resubmit the job.

**XCD3010F**     **COULD NOT GET X'amount' BYTES OF MEMORY** *activity*

Explanation:     Could not acquire memory for the named activity.

System response:     Processing is terminated.

User action:     Rerun the job using a larger region size. If the problem persists, call Xerox Technical Support.

**XCD3011E**     **COULD NOT RELEASE X'amount' BYTES OF MEMORY FROM LOCATION X'location' name**

Explanation:     This is an internal error.

System response:     Document processing is terminated. The XOSF address space remains active.

User action:     Call Xerox Technical Support.

**XCD3016E**     **COULD NOT** *operation* **MEMBER** *member name* **OF LIBRARY** *dataset name/ddname* *action*.  
**LDM RC=X'return code'**

Explanation:     The specified resource member could not be found in the specified library.

System response:     Document processing is terminated.

User action:     Add the member to the resource library or remove the reference to the library member from the document.

**XCD3020E**     **COULD NOT** *operation* **MEMBER** *member name* **IN PRIMARY OR SECONDARY FORM LIBRARY**

Explanation:     The document called for a form that XPAF could not find in either the primary or secondary form library.

System response:     Document processing is terminated.

User action:     Load the named form into one of the form libraries that is specified in the XOSF start-up proc.

**XCD4155W MEMBER *name* WAS NOT FOUND IN THE LCDS TRIGGER LIBRARY. THE DOCUMENT WILL NOT BE SPLIT**

Explanation: The specified member was not found in the LCDS trigger dataset, referenced by the TRIGGER DD statement in the XOSF started task procedure..

System response: Document processing continues, the document will not be split.

User action: Verify that the specified member name is the correct trigger file you want to use, or create a new member, with the name supplied, in the trigger dataset

**XCD4156W UNABLE TO OPEN LCDS TRIGGER LIBRARY. THE DOCUMENT WILL NOT BE SPLIT**

Explanation: XOSF was unable to open the trigger dataset pointed to by the TRIGGER DD statement in the XOSF started task procedure.

System response: Document processing continues, the document will not be split.

User action: Check that the TRIGGER DD statement in the XOSF started task procedure points to a valid partitioned dataset.

**XCD4159W TRIGGER COMMAND INVALID: *command***

Explanation: An invalid command was entered in the trigger definition file.

System response: The invalid command is ignored. Processing continues.

User action: Edit the trigger definition file and correct the error.

**XCD4160W TRIGGER COMMAND INVALID INTEGER: *command***

Explanation: A non-integer value was entered, for the command specified, in the trigger definition file.

System response: The invalid command is ignored. Processing continues.

User action: Edit the trigger definition file and correct the error.

**XCD4161W TRIGGER COMMAND VALUE MUST BE GREATER THAN ZERO: *command***

Explanation: A value of zero was entered for a parameter that requires a value greater than zero.

System response: The invalid command is ignored. Processing continues.

User action: Edit the trigger definition file and correct the error.

**XCD4162I TRIGGER COMMAND TRACE: *command***

Explanation: This is an informational message issued during processing of the trigger definition file, when TRACE=FILE has been specified.

System response: None. Processing continues.

User action: None

**XCD4163I - NAMESTRING=string**

Explanation: This is a trace message issued when a trigger record has been found that displays the contents of the record defined by the NAMESTART and NAMELENGTH parameters.

System response: None. Processing continues.

User action: None

**XCD4164I - CHANGESTRING=string**

Explanation: This is a trace message issued when a trigger has been found that displays the contents of the record defined by the CHANGESTART and CHANGELENGTH parameters.

System response: None. Processing continues.

User action: None

**XCD4165E TRIGGER COMMAND INVALID HEX STRING: parameter**

Explanation: A non-hexadecimal value was entered, for the command specified, in the trigger definition file. Hex strings are specified by using the two character hexadecimal notation where each character is in the range 0-9, A-F.

System response: The invalid command is ignored. Processing continues.

User action: Edit the trigger definition file and correct the error.

**XCD4166I INPUT RECORD TOO SHORT TO TEST AS TRIGGER RECORD**

Explanation: This is an informational message issued during trigger tracing indicating the input record is too short to match the requirements of a trigger record.

System response: None.

User action: None.

**XCD4167I TRIGGER RECORD FOUND (CHANGE STRING DIFFERENT)**

Explanation: This is an informational message, issued during trigger tracing, indicating the record that matches the trigger definition signifies a new segment as the "CHANGE" portion of the record is different from the previously detected trigger record.

System response: None.

User action: None.

**XCD4168I      TRIGGER RECORD FOUND (CHANGE STRING SAME AS PREVIOUS)**

Explanation:      This is an informational message, issued during trigger tracing, indicating the record that matches the trigger definition has the same "CHANGE" portion of the record as the previously detected trigger record. A new segment is not created.

System response:      None.

User action:      None.

**XCD4169I      TRIGGER TEST FOR RECORD *recnum*, LOGICAL LINE NUMBER *linenum***

Explanation:      This is an informational message, issued during trigger tracing, indicating the input record number, *recnum*, and logical line number, *linenum*, of the record currently being tested. Note: Due to DJDE command merging and carriage control conversion/consolidation the record number may not match the actual input record number.

System response:      None.

User action:      None

**XCD4170I      TRIGGER:*trigger***

Explanation:      This is an informational message, issued during trigger tracing, indicating the trigger test string specified in the trigger definition file.

System response:      None.

User action:      None.

**XCD4170I      RECORD:*record***

Explanation:      This is an informational message, issued during trigger tracing, indicating the portion of the record that is defined as the trigger.

System response:      None.

User action:      None.

**XCD4173I      MEMBER *name* WAS FOUND IN THE LCDS TRIGGER LIBRARY. SPLITTING DOCUMENT PROCESS STARTS**

Explanation:      The LCDS Splitting trigger file, *name*, has been found and will be used to split the document.

System response:      None. This message is for informational purposes only.

User action:      None.

**XCD4176W MEMBER *member\_name* WAS NOT FOUND IN THE INK SUBSTITUTION TABLE LIBRARY (XINKSUBT DD)**

Explanation: XOSF was unable to open the Ink Substitution Table, member, in the PDS or PDS/E referenced by the XINKSUBT DD card in the XOSF started task procedure.

System response: Ink substitution will not be performed for this job. Processing continues.

User action: Correct and re-enter the member name used for the job, or create an ink substitution table with the specified member name.

**XCD4177I source INK "*ink1*" HAS BEEN SUBSTITUTED FOR NEW INK "*ink2*"**

Explanation: XOSF has found an ink, *ink1*, in the type of resource identified by *source*. The ink has been substituted for the new ink, *ink2*.

System response: the new ink, *ink2*, will be used.

User action: None.

**XCD4178I FORM *form\_name* USES INK: *ink\_name***

Explanation: The LCDS form, *form\_name*, contains a reference to ink, *ink\_name*

System response: None.

User action: This message is for informational purposes and identifies the inks used by an LCDS form to aid in the creation of an ink substitution table.

**XCD4178I FORM *form\_name* USES INK: *ink\_name***

Explanation: The LCDS form, *form\_name*, contains a reference to ink, *ink\_name*

System response: None.

User action: This message is for informational purposes and identifies the inks used by an LCDS form to aid in the creation of an ink substitution table.

**XCD4179W UNABLE TO OPEN THE INK SUBSTITUTION TABLE LIBRARY. INK SUBSTITUTION WILL NOT OCCUR.**

Explanation: Whilst converting an LCDS job, XPAF was unable to open the Ink Substitution Table Library

System response: Processing continues without ink substitution.

User action: Examine the XOSFLOG and look for additional messages, preceding XCD4179W, that explain why the ink substitution library could not be opened and correct the problem.

**XCD417AI MEMBER *name* WAS FOUND IN THE INK SUBSTITUTION LIBRARY AND WILL BE USED**

Explanation: XOSF found the specified member, *member\_name*, in the Ink Substitution Table Library and will use that member for substituting Ink names during the conversion process.

System response: None.

User action: None.

**XCD417BW INVALID INK SUBSTITUTION TABLE ENTRY FOUND ON RECORD *record\_number* OF *member* (*additional information text*)**

Explanation: XOSF encountered an invalid entry on the indicated record of the specified member. The reason for the error is displayed in parenthesis.

System response: The invalid entry is ignored. Processing continues.

User action: Correct the error.

**XCD4190W THE VALUE OF *value* FOR ENHANCED DJDE “*edjde*” EXCEEDS THE MAXIMUM ALLOWABLE LENGTH OF *maxlen* BYTES**

Explanation: While converting an LCDS document to PCL or PDF, XOSF encountered an enhanced DJDE ‘*edjde*’ where the value specified was longer than the maximum allowable length of *maxlen*.

System response: The value is truncated to the maximum length and processing continues.

User action: Shorten the value of the enhanced DJDE to be less than or equal to the maximum allowable length.

**XCD4191F THE VALUE OF *value* FOR ENHANCED DJDE “*edjde*” EXCEEDS THE MAXIMUM ALLOWABLE LENGTH OF *maxlen* BYTES**

Explanation: While converting an LCDS document to PCL or PDF, XOSF encountered an enhanced DJDE ‘*edjde*’ where the value specified was longer than the maximum allowable length of *maxlen*.

System response: The value is truncated to the maximum length and processing continues.

User action: Shorten the value of the enhanced DJDE to be less than or equal to the maximum allowable length.

User action:

**XCD4329E REQUESTED FONT *font name* NOT FOUND IN *library name***

Explanation: The specified font is not in the named font library or the XPAFXFI table.

System response: Document processing continues, using the default values of 8.1 LPI and 13.6 CPI.

User action: Verify that the specified font is the correct font you want to use, or create an entry in the XPAFXFI table for the missing font.

**XCD4335I      FONT INFORMATION FOR *font name* NOT FOUND IN XPAFXFI TABLE. USING INFORMATION FROM THE PRIMARY OR SECONDARY FONT LIBRARY**

- Explanation: The required entry in the XPAFXFI table does not exist for the specified font.
- System response: Document processing continues. The font information will be retrieved from the primary or secondary font library. CCMV01 will be used for both the centralized and decentralized character mapping table names for printing this document.
- User action: Verify that the specified font is the correct font you want to use, or create an entry in the XPAFXFI table for the specified font.

**XCD4400I      *message text***

- Explanation: You specified TDF=Y in your initialization parameters to activate the tracking DJDE facility. This message identifies the DJDEs going to a decentralized printer.
- System response: XOSF processing continues.
- User action: None required.

**XCD4410W      A BLANK NON-METACODE RECORD HAS BEEN IGNORED.**

- Explanation: While processing a metacode data stream, an input record containing all EBCDIC spaces (X'40') and a carriage control of X'09' (Space-one-after) was encountered.
- System response: Processing continues, but the blank record will be ignored. Since there are no metacodes or ASCII data in the record, it is assumed that this record was inserted erroneously.
- User action: If a line of @-signs is really desired (ASCII X'40') the data stream should be changed to include an EOL metacode (X'01') at the end of the print line. This will insure that the line is recognized as a metacode print line and will not be dropped.

**XCD4504E      FRM CONTAINS NO DATA EXCEPT HEADER**

- Explanation: While processing the centralized form header, the number of blocks in the form data was found to be zero.
- System response: Centralized-to-decentralized form conversion is terminated.
- User action: Check for form compilation errors. Correct any errors, and recompile the centralized form.

**XCD4506E      FRM CONTAINS UNSUPPORTED TEXT LINE INFORMATION**

- Explanation: The form header indicates that extended text line format was used. This conversion does not support extended line format
- System response: Centralized-to-decentralized form conversion is terminated.
- User action: This message is accompanied by a message from the Environmental Envelope. Refer to the user action for that message.

**XCD4508E PREVIOUS ERROR. TRANSFORM TERMINATED**

Explanation: A previous error was detected on return to the main conversion processor.  
 System response: Centralized-to-decentralized form conversion is terminated.  
 User action: Refer to the user action for the previously displayed error message.

**XCD4510E** *resource name* **READ FROM** *library name* **WAS NOT A specified format**

Explanation: The resource read from the specified library was not in the format defined for that library.  
 System response: Document processing is terminated and the document is requeued.  
 User action: Ensure that the FORMLIB and IMAGELIB printer profile parameters point to decentralized resource libraries and that the SFORMLIB and SIMAGELIB printer profile parameters point to the centralized resource libraries. Delete any centralized resources from the decentralized libraries and resubmit the job.

**XCD4511F FORM form REFERENCES UNDEFINED COLOR 'color'**

Explanation: While converting the LCDS.FRM, *form*, to decentralized format, XPAF encountered a color ink reference, *color*, which is not defined in the color conversion table.  
 System response: Document processing is terminated. The document is aborted and placed in hold status.  
 User action: Add the color to the color conversion table and release the held job.

**XCD4512F FORM form REFERENCES UNDEFINED COLOR 'color'. PALETTE COLOR NOT FOUND**

Explanation: While converting the LCDS.FRM, *form*, to decentralized format, XPAF encountered a color ink reference, *color*, which calls for ink 'H100', which is not defined in the color conversion table. Since 'H100' may be defined in multiple palettes, XPAF attempted to locate an color ink reference with the same name as the palette, but he color palette is not defines in the color conversion table.  
 System response: Document processing is terminated. The document is aborted and placed in hold status.  
 User action: Add the color to the color conversion table and release the held job.

**XCD4508E FORM form REFERENCES UNDEFINED COLOR 'color'**

Explanation: While converting the LCDS.FRM, *form*, to decentralized format, XPAF encountered a color ink reference, *color*, which is not defined in the color conversion table.  
 System response: Document processing is terminated. The document is aborted and placed in hold status.  
 User action: Add the color to the color conversion table and release the held job

## **XCD450DE DOUBLE BYTE FONTS NOT SUPPORTED**

- Explanation: While processing the form header, double-byte fonts (Kanji characters) were found in the form.
- System response: Centralized-to-decentralized form conversion is terminated. The form cannot be converted.
- User action: None required.

## **XRF6256E SEVERE ERROR ENCOUNTERED BY XCDOUT. *reason***

- Explanation: This is an internal error.
- Reason* is one of these conditions:
- NO FONTS AVAILABLE TO PRINT DOCUMENT
  - FONT REFERENCED NOT IN FONT LIST, FONT0 USED
  - DATA/COMMAND BUFFER IS FULL.
- System response: Document processing is terminated.
- User action: Call Xerox Technical Support

## **XCD6402E COULD NOT *command* ITEM *table entry* IN TABLE *table name* operation. THM RC=X'*return code*'**

- Explanation: This message is issued for diagnostic purposes. *Operation* identifies the type of processing that was being performed when the error occurred. The specified table entry was not found in the specified table.
- System response: Dependent on the severity of the error.
- User action: Correct the table entry in the specified table:
- The named paper name entry should be corrected in the named paper name table.
  - The named cluster name entry should be corrected in the named cluster mapping table.
  - The named character mapping table entry should be corrected in the XPAFA2A table.
  - The named font name entry should be corrected in the XPAFXFI table.

## **XCD6413E IMAGE *image name* CANNOT BE ACCESSED IN SUPPLIED LIBRARIES**

- Explanation: The indicated image could not be found in either the primary or secondary library.
- System response: The requested image is ignored and processing continues.
- User action: Supply the image in the correct library as named in the printer's profile.
- Note: If this message is received indicating that the XPAFXFI table entry is missing for a recently loaded font, shutdown and restart the XOSF FSS to pick up the new XPAFXFI entry.

**XCD7009F**    *module name* **RECEIVED AN INVALID FUNCTION REQUEST CODE.**  
**FUNCTION=C'command' OR X'command'**

Explanation:    This is an internal error. This message may indicate incompatible communications specifications.

System response:    Document processing is terminated. The printer is drained.

User action:    If you are using either the 871 CM or BARR/SNA RJE to remotely attach a centralized printer to the host, ensure that the printer's profile specified XNS=NO. In the printer's profile, the default is XNS=YES because centralized printers are normally channel-attached.

**XCD7101E**    *module name* **RECEIVED AN INVALID REQUEST OF** *invalid request*

Explanation:    An incorrect function request was made to the named module. This is an internal error.

System response:    Document processing is terminated.

User action:    Call Xerox Technical Support.

**XCD7501E**    **LDM** *command* **ERROR. EC=X'error code'**

Explanation:    An error occurred while processing an LDM command.

System response:    Document processing is terminated.

User action:    Call Xerox Technical Support.

**XCD9099E**    **UNABLE TO ALLOCATE STORAGE FOR** *activity*

Explanation:    Storage was needed for the stated *activity* but could not be obtained.

System response:    Document processing is terminated.

User action:    Verify that the region size is large enough to acquire work areas, and resubmit the job.

## XCN messages

---

**XCN0301I**     **FONT** *font name* **CONVERTED TO CODE PAGE** *code page name*, **CHARACTER SET** *character set name*

Explanation:     Font metrics conversion completed successfully. The named font was converted to the named code page and character set.

System response:     XOAF processing continues.

User action:     Run DCFINDEX before you compile a DCF document that references the converted Xerox font.

**XCN0303E**     **FIRST RECORD OF** *dataset name* **IS NOT A VALID HEADER RECORD**

Explanation:     The format of the first record in the named dataset does not conform to the required Xerox header record format.

System response:     Font conversion is terminated.

User action:     Verify that the input dataset is a font.

**XCN0304E**     **SECOND RECORD OF** *font name* **IS NOT A VALID DESCRIPTION RECORD**

Explanation:     The format of the second record of the indicated font in the dataset does not conform to the required Xerox description record format.

System response:     Font conversion for the indicated font is terminated.

User action:     Verify that the input dataset contains a valid font.

**XCN0305E**     **COULD NOT** *command* **TABLE** *table name operation*. **THM RC=X'***return code'*

Explanation:     An attempt to process the named table failed. *Operation* identifies the type of processing that was being performed when the error occurred.

System response:     Font conversion is terminated.

User action:     Call Xerox Technical Support.

**XCN0306E**     **FONT** *font name* **FAILED TO CONVERT. SEE LOG FOR MORE INFORMATION**

Explanation:     The named font was not converted.

System response:     Font conversion is terminated.

User action:     Examine the XOAF or system log to determine the cause of the failure.

Also, verify that the named centralized font is not FORMSX or FORMS\$. FORMSX and FORMS\$ have an equivalent decentralized font and are not subject to centralized-to-decentralized font conversion.

**XCN0307I      FONT *font name* CONVERTED TO CHARACTER SET *character set name***

Explanation:      The named Xerox font was converted successfully to the named IBM font. In addition to the indicated character set, a coded font was generated with the same name as the indicated font. The coded font begins with an *Xn* prefix (where *n* is the same number as in the character set number).

System response:      Processing continues.

User action:      Run DCFINDEX before you compile a DCF document that references the converted Xerox font.

**XCN0325I      FONT *font name* CONVERTED**

Explanation:      The named Xerox font was successfully processed by Xerox-to-IBM font conversion. Since no output file was specified for the conversion, an IBM character set was not created. However, the required table entries in TABLELIB were updated.

System response:      Processing continues.

User action:      None required.

**XCN030AE      *entry* NAME MISSING FROM FONT INFORMATION TABLE FOR FONT *font name***

Explanation:      While trying to convert Xerox font metrics for the named font, the XPAFXFI table entry for the font was found to be missing the input (Xerox) code page name.

System response:      Font metrics conversion for this font is terminated. If other fonts are being converted, processing of those fonts continues.

User action:      Add the appropriate code page name to the XPAFXFI table entry for the font, then retry the conversion.

**XCN1701I      *requested count resource* PROCESSED. *converted count resource* CONVERTED. SEE LOG FOR DETAILS**

Explanation:      This message lists the number of fonts processed and the number of fonts converted successfully.

System response:      Processing continues.

User action:      Check the XOAF or system log for information about any unconverted fonts.

**XCN1706I      UNABLE TO LOCATE MEMBER (*member name*)**

Explanation:      When using the XOAF option to convert a Xerox font to IBM format, an invalid member name was specified in the 'Member Name' field.

System response:      Font conversion is terminated.

User action:      Verify that the member name is located in the specified library, and that the member name is spelled correctly. If wildcards are being used, verify that at least one member in the specified library matches the wildcard name. Once any errors have been corrected, retry the option.

**XCN3010F      COULD NOT GET X'bytes of memory' BYTES OF MEMORY activity**

Explanation:      This is an internal error.  
 System response:      Font conversion is terminated.  
 User action:      Call Xerox Technical Support.

**XCN3011E      COULD NOT RELEASE X'bytes of memory' BYTES OF MEMORY FROM LOCATION X'address' activity**

Explanation:      XPAF encountered an error while attempting to release storage to the operating system.  
 System response:      The current operation is terminated.  
 User action:      This is generally an internal error within XPAF. If the problem persists, call Xerox Technical Support.

**XCN3015E      COULD NOT operation LIBRARY dataset name activity. LDM RC=X'return code'**

Explanation:      XPAF could not perform the named activity on the specified library.  
 System response:      Font conversion is terminated.  
 User action:      Ensure the library exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XCN3016E      COULD NOT operation MEMBER member name OF LIBRARY dataset name activity. LDM RC=X'return code'**

Explanation:      XPAF could not perform the named activity on the specified member.  
 System response:      Processing of the named member is terminated. Processing of other members continues.  
 User action:      Ensure the member exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XCN3017E      COULD NOT operation LCA activity. LDM RC=X'return code'**

Explanation:      This is an internal error.  
 System response:      Font conversion is terminated.  
 User action:      Call Xerox Technical Support.

**XCN3018E      COULD NOT ACQUIRE TCB activity. THM RC=X'return code'**

Explanation:      This is an internal error.  
 System response:      Font conversion is terminated.  
 User action:      Call Xerox Technical Support.

**XCN6402E**    **COULD NOT** *command* **ITEM** *item name* **IN TABLE** *table name* *operation*. **THM RC=X'***return code'*

Explanation:    This message is issued for diagnostic purposes. *Operation* identifies the type of processing that was being performed when the error occurred.

System response:    Font conversion is terminated.

User action:    If the message indicates that an item could not be read, ensure that the item exists and you have properly specified the name. If the problem persists, call Xerox Technical Support.

## XDI messages

---

### **XDI0001I      ERROR - PDS REFRESH NO LONGER REQUIRED OR SUPPORTED**

Explanation: This is an informational message that is issued in response to a MODIFY (F) command to an XOSF address space requesting a refresh of a PDS library. With the introduction of AUTOREV support, PDS libraries no longer require refreshing and the REFRESH command is no longer supported.

System response: Processing continues.

User action: No action required.

### **XDI0002I      XBPAM OPEN FAILED, PAMFUNRC=*rc***

Explanation: While attempting to open the user job type table for XJOBTYPE=USER processing, an error was detected.

System response: Processing is terminated for the current document.

User action: Check the value of the XPSMJOB initialization parameter. Verify that the specified member exists and is available to XPAF.

### **XDI0203E      THM ERROR IN MODULE *module name*. CMD=*thm command*; IC=X'*thm-information code*'; RC=X'*thm-return code*'**

Explanation: While attempting to process an XPAF VSAM dataset, an unexpected error was encountered. Other messages are usually issued along with this message to further identify the operation that failed.

System response: The current operation is terminated.

User action: Verify that all of the required XPAF libraries are present and not corrupted. If you believe you are receiving this message in error, please call Xerox Technical Support.

### **XDI021AE      *action* FAILED. UNABLE TO ACQUIRE *bytes of storage* BYTES OF STORAGE FOR *area*. RC=X'*return code*'.**

Explanation: The indicated option was unable to acquire the indicated number of bytes for the named area.

System response: XOAF processing is terminated.

User action: Increase the region size and rerun the request. If the problem persists, call Xerox Technical Support.

**XDI0221E**      *option* **FAILED. TABLE** *table name* **NOT FOUND IN DDNAME** *table library ddname*

Explanation:      The failed option was attempted for the specified table, but the table name could not be found in the dataset associated with the specified DD name.

System response:      Document processing is terminated. The document is requeued to hold status.

User action:      Correct the table name or the DD name, then resubmit the job.

**XDI0724E**      **LDM ENCOUNTERED AN ERROR TRYING TO** *action*

Explanation:      XOSF encountered an error while attempting to open the printer profile dataset. The *action* can be one of the following:

- GET LCA, which generally occurs because of a memory shortage.
- ALLOCATE PROFILE PARMLIB, which occurs because the DD name specified in the PROFDD initialization parameter is invalid or the DD statement is missing from the XOSF start-up proc.
- BLDL PROFILE LIBRARY, which indicates that either there is a memory shortage or a permanent I/O error was detected when the system attempted to process the printer profile dataset.

System response:      XOSF is not initialized.

User action:      Ensure that the PROFDD initialization parameter points to a valid DD name. The default for this parameter is XINPARM. Verify that the DD statement is included in the XOSF start-up proc, and that the printer profile dataset is usable.

**XDI2605W**      **REQUEST FROM** *operator/tso id* **TO** *activity on/off/user text* **WAS FAILED BY USER SECURITY EXIT WITH RC=X'return code'**

Explanation:      The refresh security exit could not process the request from the indicated user.

System response:      Command processing is terminated.

User action:      Call Xerox Technical Support.

**XDI2608I**      **REQUEST TO SET REFRESH SECURITY** *on/off/user text* **PROCESSED SUCCESSFULLY**

Explanation:      You issued a SET REFRESH SECURITY command to set the refresh security on or off, or to pass user-defined data to the refresh security exit.

System response:      The request was processed successfully.

User action:      None required.

**XDI2609W      KEYWORD MISSING ON SET REFRESH SECURITY COMMAND**

Explanation:      You issued a SET REFRESH SECURITY command to set the refresh security exit, but omitted either a user text string or the required keyword ON or OFF.

System response:      Command processing is ignored.

User action:      Reissue the command specifying either ON, OFF, or a text string in quotes (up to 72 bytes).

**XDI2610W      USER REFRESH SECURITY EXIT NOT ACTIVE**

Explanation:      You issued a SET REFRESH SECURITY command to set refresh security with a user-defined text string, but the exit is not active. The exit may not be installed, or it may have been turned off previously by an abend.

System response:      Command processing is ignored.

User action:      Verify that the user exit is installed properly. Correct any problems that may have caused the user exit to abend. Restart XOSF.

**XDI2625W      UNABLE TO LOAD PROGRAM *load module name* FOR USER EXIT**

Explanation:      During initialization, you specified the name of a load module to be used as a user exit in the USRXIT $nn$  initialization parameter. XOSF could not locate the specified load module.

System response:      Processing continues. The user exit is marked inactive and is not called.

User action:      Verify that the name entered in the USRXIT $nn$  initialization parameter is specified and spelled correctly, is alphanumeric, and is all uppercase. Also verify that the load module has been link-edited into either the z/OS link list library or the XPAF STEPLIB on the system where XOSF is executing.

In addition, you should confirm that no errors occurred while link-editing the user exit load module, and verify that it has not been marked nonexecutable.

If the exit is found in the z/OS link list library, make certain that the LLA has been refreshed since the exit was link-edited, establish that the LLA is inactive, or that an IPL has been performed for z/OS since the exit was link-edited.

If the exit is found in the XPAF STEPLIB or the problem persists, call Xerox Technical Support.

**XDI3010F      COULD NOT GET X'*bytes*' BYTES OF MEMORY *activity***

Explanation:      The memory required for the specified activity could not be acquired.

System response:      Normal processing for the job continues. Processing for the requested address space is disabled.

User action:      Increase the region size of the requested address space. Restart the address space and resubmit the job.

**XDI3011E      COULD NOT RELEASE X'bytes of memory' BYTES OF MEMORY FROM LOCATION X'address' activity**

Explanation:    XPAF encountered an error while attempting to release storage back to the operating system.

System response:    The current operation is terminated.

User action:    This is generally an internal error within XPAF. If the problem persists, call Xerox Technical Support.

**XDI3401E      INVALID XOSF OPERATOR COMMAND**

Explanation:    You entered an invalid XOSF command.

System response:    Command processing is ignored. XOSF processing continues.

User action:    Enter the correct command.

**XDI3402I      task name XOSF FSS CONNECTED TO subsystem name**

Explanation:    During initialization, the FSS level of the XOSF address space established communication with the spool subsystem, either JES2, JES3, or another non-JES subsystem.

System response:    The named subsystem initiates the processing that requests an FSA printer level connection.

User action:    None required.

**XDI3403E      task name XOSF FSS TERMINATING ABNORMALLY**

Explanation:    The FSS-level task of the XOSF address space encountered an unrecoverable error. A system dump may be produced.

System response:    The XOSF address space is terminated.

User action:    Restart XOSF.

**XDI3404E      XOSF level of connection NOT CONNECTED TO subsystem name. RC=X'return code'; REASON CODE=X'reason code'**

Explanation:    XOSF attempted to connect to the named subsystem, but the subsystem was unable to establish the connection as indicated by the return and reason codes.

System response:    Processing is terminated, and the XOSF address space is terminated.

User action:    Attempt to restart the printer under which the address space was started. If this attempt fails, call Xerox Technical Support.

**XDI3405I      task name XOSF ADDRESS SPACE ENDING**

Explanation:    The XOSF FSS environment was requested to terminate normally.

System response:    Processing is completed.

User action:    None required.

**XDI3406E      z/OS/370 SP IS NOT SUPPORTED**

Explanation:    You tried to start XPAF in an unsupported environment.  
System response: XPAF initialization is terminated.  
Ensure that you are using an operating environment that is supported. For the minimum z/OS/JES levels currently supported by XPAF, refer to [Section Two: Installing and Customizing XPAF](#).

**XDI3407I      REFRESH COMPLETED FOR PDS TYPE *pds type*, DDNAME=*ddname***

Explanation:    A PDS refresh was requested for the specified PDS type.  
System response: The refresh completed successfully.  
User action:     None required.

**XDI3408E      INTERNAL ERROR: UNABLE TO LOCATE THE XSLCB**

Explanation:    In XDIRFTSK, the LOCSLCB macro did not return the address of the XSLCB.  
System response: Refresh processing is terminated.  
User action:     Call Xerox Technical Support.

**XDI3409E      INTERNAL ERROR: PROGRAM LOGIC ERROR. ECB OFFSET=X'*offset value*'**

Explanation:    While determining which ECB was posted in XDIRFTSK, the search went beyond the last ECB on the list.  
System response: Refresh processing is terminated.  
User action:     Call Xerox Technical Support.

**XDI3410W      REFRESH THRESHOLD HAS BEEN EXCEEDED**

Explanation:    The maximum PDS refresh limit (as defined by the REFRSHMAX initialization parameter) has been reached for the day.  
System response: The refresh operation is not performed.  
User action:    You can reset the refresh count using the RESET THRESHOLD operator command. After the reset, you can reissue the REFRESH command that failed. If you are frequently exceeding the refresh limit, you may want to increase its value as specified in your XINPARM library.

**XDI3411I      REFRESH THRESHOLD RESET TO *threshold***

Explanation:    You issued a RESET THRESHOLD command to change the maximum number of times the PDS REFRESH command can be executed in a single day.  
System response: The system shows the new threshold.  
User action:    None required.

**XDI3412E      STARTING SUBSYSTEM, *actual subsystem name*, DOES NOT MATCH SUBSYSTEM EXPECTED BY XOSF: *expected subsystem name***

Explanation:      The actual subsystem that started XOSF does not match the expected communicating subsystem specified in the XOSF COMSSID initialization parameter.

System response:      XOSF initialization is terminated.

User action:      Correct the value specified in the XOSF COMSSID initialization parameter. Ensure that XOSF is defined correctly to the starting subsystem. For JES, this is done in the FSSDEF statement in the JES2 or JES3 initialization parameters. For non-JES subsystems, refer to the installation instructions for those products.

**XDI3413E      OPEN FOR DSNAME *dataset name* FAILED**

Explanation:      An unsuccessful attempt was made to open the named log dataset.

System response:      Processing continues, but the log dataset is disabled.

User action:      Look at the messages that were issued prior to this message to determine the cause of the failure. If further assistance is required, call Xerox Technical Support.

**XDI3414W      JES2 HCCT NOT FOUND. DEFAULT JES2 COMMAND CHARACTER ASSUMED**

Explanation:      The JES2 HCCT control block, where the command character for JES2 commands is maintained, was not found because the SSCTSUS2 field of the primary JES2 SSCT did not have a valid address. Also, the CONCHAR initialization parameter was either not specified, or was specified with the default value of \$.

System response:      The JES2 command character default, \$, is assumed. Any user-defined command character is ignored.

User action:      Specify a user-defined command character via the CONCHAR initialization parameter that matches the command character specified in your JES2 initialization parameters. If the problem persists, call Xerox Technical Support.

**XDI3416E      UNRECOGNIZED SUBSYSTEM. XCOMSENV=X'*xosf environment flag value*'. XCOMSSTY=X'*xosf subsystem flag value*'**

Explanation:      This is an XOSF internal error.

System response:      The printer is drained.

User action:      Call Xerox Technical Support with the flag values.

**XDI3417I**     *jobnumber jobname stepname ddname* **PRINTING** *status* **ON** *printer name* **AT** *system name*

Explanation:     The print request has completed output processing for the identified job on the identified printer at the named system. The submitter of the print job used the NOTIFY IBM JCL keyword to identify which user IDs should be notified when the print request has completed.

The printing status of the identified job on the identified printer is one of these options:

- Canceled: the operator or XPAF has canceled the job
- Completed: the job has completed normally
- Interrupted: the operator has interrupted the job
- Restarted: the operator has restarted the job
- Forward spaced: the operator has forward spaced the job
- Backspaced: the operator has backspaced the job

System response:     XOSF processing continues.

User action:     None required.

**XDI3418E**     **I/O ERROR READING DSNAME=***dataset name*. **RC=X**'*return code*'

Explanation:     This is an internal error.

System response:     Command processing is ignored. XOSF processing continues.

User action:     Call Xerox Technical Support.

**XDI3419I**     *printer name job number ddname* **IMPRESSIONS=***side count* **PAGES=***page count*  
**ETIME=***elapsed time*

Explanation:     At the end of each dataset transmission, the FSA logs the total number of impressions, the total number of pages, and the elapsed time in minutes and tenths of a minute.

System response:     None.

User action:     None required.

**XDI3420E**     **INVALID JES2 (PDDB NOT FOUND) CONTROL BLOCK** (*printer name*)

Explanation:     The FSA was unable to find the JES2 PDDB for the current dataset.

System response:     The FSA is terminated.

User action:     Restart the printer (FSA) and call Xerox Technical Support.

**XDI3421E**     **INVALID JES2 (GCBIOT=0) CONTROL BLOCK** (*control block name*)

Explanation:     The FSA found a "zero" anchor in the GCB control block for GCBIOTTR.

System response:     The FSA is terminated.

User action:     Restart the printer (FSA) and call Xerox Technical Support.

**XDI3422E      INVALID FSA (*control block name*) CONTROL BLOCK (*printer name*)**

Explanation:    The FSA found an invalid FSS control block.  
 System response: The FSA is terminated.  
 User action:    Call Xerox Technical Support.

**XDI3423I      *printer name* FSA CONNECTED TO *subsystem name***

Explanation:    The FSA established connection with the spool subsystem. Subsystem name is JES2, JES3, or another non-JES subsystem.  
 System response: The named subsystem acknowledges connection with the FSA and continues printer start-up.  
 User action:    None required.

**XDI3424E      XOSF (NUCLEUS) REQUESTS FSA TERMINATION (*printer name*)**

Explanation:    The FSA encountered an error condition and was requested to terminate by the NUCLEUS subcomponent.  
 System response: The FSA is terminated.  
 User action:    Check the system and XOSF logs for additional messages and error information. Try to restart the FSA. If the problem persists, call Xerox Technical Support.

**XDI3425E      (*job number*) (*job name*) INCOMPLETE REQUEUED (*printer name*)**

Explanation:    The FSA encountered an error that caused XOSF to stop processing documents.  
 System response: The FSA stops processing the current document and requeues the data to JES.  
 User action:    Check the system and XOSF logs for additional messages and error information relating to the document transmission. Check the printer type and its resources to make sure they are compatible with the document type. Restart the printer (FSA).

**XDI3426E      FSA DOCUMENT CLOSE PROCESSING ERROR (*printer name*)**

Explanation:    The FSA encountered an error during document CLOSE processing.  
 System response: The FSA is terminated.  
 User action:    Restart the printer (FSA). Do not allow JES to schedule this document. Check the system log for additional information about this document transmission.

**XDI3427E FSA JES CHECKPOINT ERROR** (*printer name*)

Explanation: The FSA encountered an error while taking a checkpoint during document transmission.

System response: The FSA is terminated.

User action: Restart the printer. Check the system and XOSF logs for more information about this document. Review the z/OS/JES logs for an indication of errors.

**XDI3428E FSI GETREC FAILURE IDX/EOF/IOE** (*printer name*)

Explanation: The FSA tried to get the next logical record from JES and encountered an error indicator set by the FSI.

System response: Depending upon the severity of the error, the FSA either is terminated or reschedules the document.

User action: Restart the printer. If the problem persists, call Xerox Technical Support.

**XDI3429W SJF ERROR ON DEVICE** *printer name*. **SJF RC=X'return code' OR X'reason code'; JDVTNAME=jdvt name; KWL=X'kwl address'**. *message text*

Explanation: An error occurred while SJF was processing a request. The first 4 bytes of SJFRC indicate the SJF return code; the last 4 bytes indicate the SJF reason code. *jdvt name* is the name of the JDVT that the request was processed against. If the name is omitted, then the request is for the default JDVT. The keyword list (KWL) is the address of the list of keywords being processed for this request. Any additional message text is a description of the SJF reason code associated with this SJF request.

System response: An attempt will be made to process the document. However, no extended JCL keyword values will be applied to the document. Unpredictable results may occur.

User action: Call Xerox Technical Support.

**XDI3430I** (*job number*) (*proc name*) (*step name*) (*ddname*) **COPY** *current copy count* **OF** *total copy count* **SELECTED FOR** (*printer name*)

Explanation: For each dataset within a job, XOSF displays the current document being transmitted to a particular printer.

System response: None.

User action: None required.

**XDI3431I** (*job number*) (*job name*) (*user-id*) **TRANSMITTING TO** (*printer name*)

Explanation: This message identifies the JES job number, job name and submitter's user-id of the job that is currently active on the specified printer.

System response: The job is transmitted to the printer.

User action: None required.

**XDI3432W JCL RETRIEVE ERROR FOR *job number job name* ON *printer name*. SJF RC=nnnnnnnn**

- Explanation: An error occurred during the initialization processing of a document to be transmitted. SJF service errors were encountered while retrieving JCL parameters originally specified when the job was executed. The return code is in hexadecimal.
- System response: XPAF attempts to transmit the document using known or default characteristics.
- User action: The user action depends on the return code issued:
- If RC='X000000C', increase the value of the REGION parameter on the XOSF start-up proc or increase the value specified in the XCORE initialization parameter.
  - If RC='X00000014' or 'X00000020', ensure that the XPAFJCL job has been run to install XPAF extended JCL on:
    - The system on which XPAF is running
    - The system where the job that created the document was originally executed

If the systems are different, both need to be running the same maintenance level of XPAF extended JCL.

You also should verify that you performed an IPL with CLPA after applying XPAF maintenance to XFSJDT00 or XESJDT00.
  - For all other return codes, call Xerox Technical Support.

**XDI3433E FSA CONNECT FAILURE (FSICON) FOR (*printer name*). FSI RC=X'*return code*'; FSI REASON CODE=X'*reason code*'**

- Explanation: XPAF was unable to connect the FSA printer task to JES.
- System response: The task is terminated.
- User action: Call Xerox Technical Support.

**XDI3434E FSA ABNORMAL TERMINATION FOR DEVICE (*printer name*). ABEND CODE X'*abend code*'**

- Explanation: The ESTAE routine intercepted an abend that occurred during XOSF FSA processing while printing a SYSOUT dataset or during printer initialization or termination.
- System response: The printer is drained. All other XOSF tasks continue processing.
- User action: Review preceding error messages for SYSOUT dataset or environmental errors. If preceding messages do not clarify this error, call Xerox Technical Support.

**XDI3435I FSA DISCONNECTING FOR DEVICE (*printer name*)**

- Explanation: The FSA disconnects for this printer.
- System response: The FSA is terminated.
- User action: None required.

**XDI3436E      FSA STOP DEVICE FAILURE FOR (*printer name*). RC=*return code***

Explanation:    The FSA encountered an error while stopping this printer.  
System response:    Normal processing cannot continue. The FSA is terminated.  
User action:      Restart the printer (FSA).

**XDI3437E      FSA START DEVICE FAILURE FOR (*printer name*). RC=*return code***

Explanation:    The FSA encountered an error while starting this printer.  
System response:    The FSA is terminated.  
User action:      Restart the printer (FSA).

**XDI3438E      FSA GET DATASET FAILURE FOR (*printer name*). RC=*return code***

Explanation:    The FSA encountered an error while requesting a dataset allocation from JES.  
System response:    The FSA is terminated.  
User action:      Call Xerox Technical Support.

**XDI3439E      FSA OPEN INITIALIZATION ERROR FOR (*printer name*). RC=*return code***

Explanation:    The FSA was unable to start processing the document. The XOSF OPEN DOCUMENT process encountered an unrecoverable error condition.  
System response:    The FSA is terminated.  
User action:      Study the system log for more information.

**XDI3440E      FSA SYSOUT PROCESSING FAILURE FOR (*printer name*). RC=*return code***

Explanation:    An error occurred during document transmission processing. The error was so severe that the FSA could not continue.  
System response:    The FSA is terminated.  
User action:      Examine the system log for more information.

**XDI3442E      FSA POSTED IN ERROR WITH NO DSNAME (*printer name*)**

Explanation:    This is an internal error.  
System response:    The FSA is terminated.  
User action:      Call Xerox Technical Support.

**XDI3443I      DEVICE ACQUIRED. READY FOR WORK** (*printer name*)

Explanation:    The FSA successfully reacquired the printer and is ready to begin normal processing.

System response: Documents that JES has queued to this printer are processed.

User action:    None required.

**XDI3444I      FSA UNABLE TO ACQUIRE SHARED DEVICE** (*printer name*)

Explanation:    The FSA tried to acquire the specified printer for *nnnnn* minutes, where *nnnnn* is specified by the SHRACQTIME initialization or printer profile parameter. During that time, the printer was not available.

System response: The FSA is terminated for the specified printer.

User action:    Restart the FSA when the printer is available.

**XDI3445I      ATTEMPTING TO ACQUIRE SHARED DEVICE** (*printer name*)

Explanation:    If there is output scheduled by JES, the FSA tries for *nnnnn* minutes to acquire the specified printer where *nnnnn* is specified by the SHRACQTIME initialization or printer profile parameter. This message is issued every *nnnnn* minutes, where *nnnnn* is specified by the SHRMSGINT initialization or printer profile parameter.

System response: The system tries to acquire the specified printer.

User action:    None required.

**XDI3446I      FSA HAS RELEASED SHARED DEVICE** (*printer name*)

Explanation:    The FSA has released the specified printer. The thread remains available and JES continues to schedule output for that printer.

System response: If there is output scheduled for the specified printer, the FSA tries to reacquire the printer.

User action:    None required.

**XDI3447I      REQUEST FOR SHARED DEVICE RELEASE** (*printer name*)

Explanation:    A printer that is currently allocated to an FSA was requested by another application.

System response: When the printer is available for release (when it is not currently active), XOSF releases it. The FSA does not disconnect.

User action:    None required.

**XDI3448I XOSF DEVICE SHARING ENABLED FOR (*printer name*)**

Explanation: XOSF encountered a printer for which device sharing has been enabled.  
 System response: The printer is eligible to be shared with multiple XPAF applications or within the current XOSF address space.  
 User action: None required.

**XDI3449I FSA HAS BEEN REQUESTED TO TERMINATE FOR (*printer name*)**

Explanation: The printer was requested to terminate because of an error condition or was shut down by the operator.  
 System response: The printer task is terminated.  
 User action: Check the z/OS console log or XLOG for other error messages immediately preceding this message.

**XDI3450E FSA ENVIRONMENT SETUP FAILURE. FSA ENDING**

Explanation: During the setup of an FSA, an error occurred that prevented further initialization.  
 System response: The printer thread is terminated. The FSS address space remains active for other printers.  
 User action: Allocate more storage to XPAF and restart the FSA.

**XDI3451E DEVICE INIT REQUEST FAILED FOR (*printer name*). RC=*return code***

Explanation: The FSA was unable to allocate or initialize the specified printer.  
 System response: The FSA is terminated.  
 User action: Check the XOSF log for more messages.

**XDI3452E SUBSYSTEM NAME (*xosfname*) IS ALREADY IN USE BY ANOTHER XOSF ADDRESS SPACE**

Explanation: The named subsystem was specified for the SUBSYS initialization parameter for this address space, but the name is being used by another XOSF address space.  
 System response: XOSF is terminated.  
 User action: Change the value specified for the SUBSYS initialization parameter to a valid subsystem name that is not specified for any other XOSF subsystem. To determine subsystem name an active XOSF address space is currently using, enter the DISPLAY SUBSYS command.

**XDI3453E XOSF FSS (*xosfname*) NOT FOUND OR NOT DEFINED**

Explanation: The initialization process could not find the named subsystem.

System response: XOSF is terminated.

User action: Verify the XPAF subsystem name is included in member IEFSSNxx of SYS1.PARMLIB. If the XPAF subsystem name is included and you received this message, or if you have just added the XPAF subsystem name, you will need to re-IPL your system for the changes to take effect. Refer to [Section Two: Installing and Customizing XPAF](#).

**XDI3454E XDI OFFSET TABLE NOT FOUND OR LOADED (XDIOFTAB)**

Explanation: The XDIOFTAB could not be found in a library available to the FSS or could not be loaded into memory.

System response: XPAF initialization is terminated.

User action: The source XDIOFTAB shipped with XPAF must be assembled and linked into the XPAF library per the installation instructions. Install the XDIOFTAB module at the user level.

**XDI3456E z/OS VERSION/LEVEL *version/level* NOT SUPPORTED**

Explanation: You tried to start XOSF in an unsupported environment.

System response: Initialization is terminated.

Ensure that you are using an z/OS level that is supported. For the minimum z/OS/JES levels currently supported by XPAF, refer to [Section Two: Installing and Customizing XPAF](#).

**XDI3457E *job entry subsystem name* VERSION/LEVEL *jcs version/level* NOT SUPPORTED**

Explanation: You tried to start XOSF in an unsupported JES environment.

System response: Initialization is terminated.

User action: The user action depends on how you define the JES subsystem:

- If you are using JES2 or JES3 as the primary subsystem, verify that the system is running the correct version and level of JES2 or JES3.
- If you are using JES2 or JES3 as a primary subsystem and have named it something other than JES2 or JES3, verify that a valid subsystem name was specified in the COMSSID initialization parameter.
- If you are using JES2 or JES3 as a secondary subsystem verify that the subsystem is started.
- If you are using JES2 or JES3 as the secondary subsystem, verify that a valid subsystem name was specified in the COMSSID initialization parameter.

For the minimum z/OS/JES levels currently supported by XPAF, refer to [Section Two: Installing and Customizing XPAF](#).

**XDI3458I XJCL ERROR ON *keyword*. *error text* PARAMETER IGNORED**

Explanation: An invalid situation was encountered with an XPAF extended JCL keyword. The error text gives more information about the nature of the problem.

System response: The keyword listed is ignored and processing continues.

User action: Correct the keyword and rerun the job.

**XDI3459E z/OS SUBSYSTEM NAME *name* NOT SUPPORTED**

Explanation: There are two possible explanations:

- The subsystem name under which XPAF is initialized is not supported by XPAF.
- In a JES3 environment, the same name is specified for both the XOSF start-up proc and the z/OS subsystem being used by XPAF. In this case, JES3 attempts to start XPAF on behalf of the z/OS Master Scheduler Subsystem (MSTR).

System response: Initialization is terminated.

User action: Ensure that the subsystem name is either JES2 or JES3. If you are operating in a JES3 environment, be sure that the XPAF subsystem name in SYS1.PLIB(IEFSSNxx) is not the same as the XOSF start-up proc name.

|                 |                    |                |                    |                          |                            |                        |                          |

| <i>task number</i> | <i>task id</i> | <i>type</i> | <i>cuu/slu</i> | <i>document id</i> | <i>status</i> |

**DISPLAY ACTIVE TASK COMMAND COMPLETED**

Explanation: You requested a display of information from XPAF.

System response: The information is displayed.

User action: For help interpreting these messages, refer to [Section Seven: XPAF Operator Guide](#).

**XDI3461I XOSF XLOG=*log dataset name* HAS BEEN REFRESHED**

Explanation: In response to the REFRESH XLOG command, the XLOG buffer was written to the named XLOG dataset. The XLOG dataset contains all the messages issued by XOSF at the time the command was issued.

System response: Processing continues.

User action: None required.

**XDI3462I UNABLE TO RELEASE LOCK FOR XSTCB CHAIN**

- Explanation: A lock was obtained using the #SLOCK macro. An attempted lock release by #SUNLOCK failed because the lock ID for the release did not match the lock ID for the lock.
- System response: The processing for the current task or job continues. Processing for subsequent tasks or jobs may be affected.
- User action: Bring the XPAF address space down, then restart XPAF. If the problem persists, call Xerox Technical Support.

**XDI3465E PRINTER (*printer name*) FSA ID (*fsa id*) HAS EXCEEDED THE MAXIMUM (*number*) PRINTERS SUPPORTED.**

- Explanation: The named printer exceeds the maximum number of subtasks that is currently supported.
- System response: The named printer is not started. All other valid printers in the address space continue normal functions.
- User action: Either increase the value of the SUBTASKS initialization parameter or create an additional FSS and move or add the named printer to the new FSS.
- Note: Although XOSF can support a theoretical maximum of 128 printers per FSS. Storage constraints may prevent that many printers from running concurrently.

**XDI3466E PRINTER (*printer name*) FSA ID (*fsa id*) HAS EXCEEDED THE MAXIMUM (*number*) PRINTERS SUPPORTED**

- Explanation: The named printer exceeds the maximum number of print devices that is currently supported.
- JES2: This message is issued when 64 printers are already started and a sixty-fifth printer is started.
  - JES3: Only the first 64 printers defined in the JES INIT deck are recognized. This message is issued when any printer other than the first 64 defined to JES is started, even if no other printers are already started.
  - CMA-SPOOL or CA-SPOOL: This message is issued when 64 printers are already started and a sixty-fifth printer is started.
- System response: The named printer is not started. All other valid printers in the address space continue normal functions.
- User action: Remove all but 64 printers from your JES INIT deck.
- JES2: Use \$PPRTnnnn to drain one printer to allow the desired printer to use the FSA.
  - JES3: Do not start any printers except the first 64 defined in the JES INIT deck.
  - CMA-SPOOL or CA-SPOOL: Use P,PRTnnnn to drain one printer to allow the desired printer to use the FSA.

**XDI3467I      LOGGING IS ACTIVE TO *xlog dataset name***

Explanation:    *xlog dataset name* identifies the dataset to which messages will be written when XOSF logging is active. This message is displayed in response to the DISPLAY ACTIVE XLOG command.

System response:    None.

User action:    None required.

**XDI3468I      LOGGING IS INACTIVE TO BOTH CURRENT AND ALTERNATE XLOGS**

Explanation:    This message indicates that neither the current nor alternate XLOG has been activated.

System response:    None.

User action:    Activate the current or alternate XLOG using one of these methods:

- Issue the SET XOSF LOGGING ON command.
- Specify XLOG=Y in the initialization parameters. If you choose this option, you must refresh the XOSF address space.

For either option to work, you must specify a valid dataset name in the XLOGDSN and/or ALOGDSN initialization parameters.

**XDI3469W    *keyword* DJDE FOUND. FURTHER CHECKPOINTING DISABLED**

Explanation:    A DJDE keyword affecting the appearance of subsequent records has been detected.

System response:    Checkpointing is terminated for this job. If the job stops and restarts for any reason, it will restart from the last valid checkpoint before the DJDE keyword was detected.

User action:    Consider not using checkpointing when printing this job in the future.

**XDI3470I      CURRENT XLOG DSNAME=*log dataset name***

Explanation:    This message identifies the current XLOG dataset name. The message appears in response to the DISPLAY ACTIVE XLOG command.

System response:    None.

User action:    None required.

**XDI3471I      ALTERNATE XLOG DSNAME=*log dataset name***

Explanation:    This message identifies the alternate XLOG dataset name. The message appears in response to the DISPLAY ACTIVE XLOG command.

System response:    None.

User action:    None required.

**XDI3472E** *function* **FAILED FOR PROGRAM** *program name* **IN** *module name*. **RC=X**'return code';  
**REASON CODE=X**'reason code'

Explanation: Either a BLDL to locate a program or a LOAD to bring a program into virtual storage was issued, but the service routine could not honor the request.

System response: The task is terminated.

User action: If the failed function is LOAD, an invalid parmlist has been specified. Call Xerox Technical Support.

If the failed function is BLDL, the action to take depends on the return and reason codes:

Return

| Code | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4    | The load module was not found. Verify that the program name exists in the XPAFLIB specified in the XOSF start-up proc. If it is not found, check the last application of XPAF maintenance or the last XPAF installation for errors on this program name. If errors are found, correct them and restart XPAF.                                                                                                                                                                                                                                    |
| 8    | Action depends on the reason code:<br><br>If the reason code is 0, an I/O error has occurred on the load library directory. Restart XPAF. If the problem persists, recreate the load library or move the location of the load library. If the condition still persists, call Xerox Technical Support.<br><br>If the reason code is 4, increase the region size and restart XPAF.<br><br>If the reason code is 8, verify that the PPT entry in SYS1.PARMLIB(SCHEDnn) specifies key 1. If the PPT entry is correct, call Xerox Technical Support. |

**XDI3473E** **GETMAIN FOR** *number* **BYTES FAILED FOR** *control block* **IN** *program name*. **RC=X**'return code'

Explanation: The program indicated issued a GETMAIN request that could not be honored.

System response: The task is terminated.

User action: Increase the region size or decrease the number of printer tasks running in the XOSF address space and restart XOSF. If the error persists, call Xerox Technical Support.

**XDI3474E      INITIALIZATION ERROR FOR ACTIVE PRINTER DEVICE LIST.** *reason*

Explanation:    An internal error occurred while allocating the APDL control block during print task initialization. *Reason* is one of these options:

- XSLCB NOT FOUND
- FIRST APDL EMPTY
- INVALID APDL FOUND
- NO MATCHING DEVICE FOUND
- NO MATCHING FSS/FSA
- APDL NOT ALLOCATED

System response:    The task is terminated.

User action:        Ensure the XPAF subsystem name in XINPARM or on the EXEC PARM statement matches the name in SYS1.PARMLIB(IEFSSNnn). Restart XOSF. If the condition persists, call Xerox Technical Support.

**XDI3475E      ERROR IN SET ESTAE RECOVERY ROUTINE FOR MODULE** *module name*. **RC=X'***return code'*

Explanation:        XPAF was unable to set an ESTAE recovery routine for the specified module.

System response:    If ESTAE=Y was specified in the initialization parameters, the task is terminated. If ESTAE=N, this error is treated as a warning and processing continues.

User action:        If the condition persists, call Xerox Technical Support.

**XDI3476E      INVALID JES FSS CONTROL BLOCK,** *control block name*, **WAS FOUND AFTER** *printer CONNECTED*

Explanation:        The FSA connect with JES was successful, but an error was encountered while validating control blocks returned by the FSI.

System response:    The task is terminated.

User action:        Call Xerox Technical Support.

**XDI3477E      INVALID JES COMPONENT SPECIFIED IN XOSF ENVIRONMENT FLAG. THE XCOMSENV VALUE IS X'***value'*

Explanation:        The XPAF environment flag, COMSENV, shows neither JES2 nor JES3 as the primary job entry subsystem.

System response:    The task is terminated.

User action:        Call Xerox Technical Support.

**XDI3478E      JES FSS/FSA NOT CONNECTED FOR DEVICE** *printer name*. **STATUS FLAG X'***value'*

Explanation:        After the FSS or FSA connected for the specified printer, an error was posted in the JES FSCB status flag.

System response:    The task is terminated.

User action:        Call Xerox Technical Support.

**XDI3479E      FSA subtask name FAILED FOR printer name. RC=X'return code'**

Explanation:    XPAF was unable to start or stop an FSA subtask for the listed device.  
 System response:    For start errors, the printer is drained. For stop errors, the printer may remain active but is unable to process additional output.  
 User action:        Call Xerox Technical Support.

**XDI3480I      LOGGING HAS BEEN ENABLED TO xlog dataset name**

Explanation:    This message appears in response to the SET XOSF LOGGING ON command.  
 System response:    None.  
 User action:        None required.

**XDI3481I      LOGGING HAS BEEN DISABLED TO xlog dataset name**

Explanation:    This message appears in response to either of these commands:  
                      SET XOSF LOGGING OFF  
                      DISPLAY ACTIVE XLOG  
 System response:    None.  
 User action:        None required.

**XDI3482E      NO ALTERNATE XLOG DSNAME SPECIFIED**

Explanation:    The SWITCH XLOG command was issued, but one of two conditions may exist:

- No alternate XLOG dataset has been specified on the PARM parameter of the EXEC statement in the XOSF start-up proc or on the ALOGDSN initialization parameter of the XINSXOSF member of XINPARM.
- The primary and alternate XLOG dataset names are identical.

System response:    The command is ignored. XOSF processing continues.  
 User action:        Create a second XLOG dataset if necessary. Update the ALOGDSN parameter on the PARM parameter of the EXEC statement or in the XINSXOSF member of XINPARM. You must restart your FSS for this to take effect.

**XDI3484E**     **JOB** *job name job number* **STEP** *step name* **DDNAME** *dataset definition* **ON** *printer name*  
**INCOMPLETE AND REQUEUED**

- Explanation:     An error occurred that prevented XOSF from completely printing the specified SYSOUT dataset.
- System response:     XOSF returns the SYSOUT dataset to JES in hold status and marks it incomplete.
- User action:     Check the log for preceding error messages pertaining to this SYSOUT dataset or printer. For the printer type specified in the printer profile member, verify that the resources are compatible with the type of SYSOUT dataset being printed.

**XDI3485E**     **NUCLEUS DOCUMENT CLOSE PROCESSING ERROR FOR JOB** *job number job name*  
**STEP** *step name* **DDNAME** *dataset definition* **ON** *printer name*. **RC=X'***return code'*

- Explanation:     An error occurred while XOSF was processing a SYSOUT dataset. The reasons for the error are explained in preceding error messages.
- System response:     The printer is drained.
- User action:     If the preceding messages do not explain the error or provide corrective action, call Xerox Technical Support.

---

**NOTE:** Do not attempt to reprint the document.

---

**XDI3486I**     *module name* **DETECTED UNSUPPORTED FSI** *fsi function ID X'**function id'*

- Explanation:     JES issued an FSI function that was not recognized as valid by XOSF.
- System response:     The FSI function is ignored. Processing continues.
- User action:     If the problem persists, call Xerox Technical Support.

**XDI3487E**     **JES2** *control block* **CONTROL BLOCK NOT FOUND FOR JOB** *job name job number* **ON**  
*printer name*

- Explanation:     When opening a JES2 SYSOUT dataset, XOSF was unable to locate the named control block.
- System response:     The SYSOUT dataset is not printed, and the printer is drained.
- User action:     Ensure installation job UMJOB101 has been run successfully. This job reapplies the JES offset table, XDIOFTAB, and must be run after XPAF or JES2 maintenance is applied.
- If the problem persists after XDIOFTAB has been reapplied successfully, call Xerox Technical Support.

**XDI3488I      JOB *job name job number* STEP *step name* DDNAME *dataset definition name* RESTARTED FROM CHECKPOINT**

Explanation: Previously, the SYSOUT dataset was partially printed. It is now being reprinted beginning from the last JES checkpoint position.

System response: The SYSOUT dataset is printed beginning from the record or page indicated by the JES checkpoint.

User action: None required.

**XDI3489I      JOB *job name job number* STEP *step name* DDNAME *dataset definition name* HELD IN JES FOR XOSF DECACHING**

Explanation: XPAF caching was selected, and the dataset is being returned to JES in hold status.

System response: After the dataset is printed from the Xerox printer disk, it is purged from JES.

User action: None required.

**XDI3492W      INVALID COMMAND TO XOSF OPERATOR INTERFACE**

Explanation: There was a syntax error in one of these commands:

- REFRESH DDNAME. DDNAME is not a valid PDS DD name.
- SET SYSTEM LOGGING ON/OFF. The last operand is not ON or OFF.
- SET SMF RECORDING ON/OFF. The last operand is not ON or OFF.
- SET STATISTICS ON/OFF. The last operand is not ON or OFF.
- TERMINATE TASK *nn*. The *nn* variable must be a numeric subtask ID.

System response: Command processing is terminated.

User action: Correct the indicated error, then reissue the command.

**XDI3493E      SUBTASK FREE CHAIN LOCK CONTAMINATED**

Explanation: When you issued the TERMINATE TASK *nn* command, XPAF detected errors in the free chain lock.

System response: Display processing is terminated. The task remains active.

User action: Shut down all printers in the XPAF address space and restart XPAF. If the problem persists, call Xerox Technical Support.

**XDI3494W      INVALID TASK ID**

Explanation: You issued the TERMINATE TASK *nn* command, but XOSF could not locate a subtask with an ID of *nn*.

System response: Display processing is terminated. The task remains active.

User action: Issue the DISPLAY ACTIVE TASKS command to determine the correct subtask number, then reissue the TERMINATE TASK *nn* command.

**XDI3496I      REFRESH THRESHOLD=*nnnnnnnn*, RESET DATE=*yyddd*, TIME=*hh:mm***

Explanation: You issued a DISPLAY REFRESH STATS command.

System response: The system displays all statistics relating to the PDS refresh facility.

- *nnnnnnnn* is the current value of the maximum refreshes allowed in a 24 hour period.
- *yyddd* is the Julian date when the maximum refresh count was set back to this value.
- *hh:mm* is the time of day when the maximum refresh count was set back to this value (*hh* is hours, *mm* is minutes).

User action: None required.

**XDI3497I      NUMBER OF REFRESHES REMAINING=*nnnnnnnn***

Explanation: *nnnnnnnn* is the number of PDS refreshes still available for the current 24 hour period. This information is displayed in response to a DISPLAY REFRESH STATS command.

System response: In related messages, the system displays all statistics relating to the PDS refresh facility.

User action: None required.

**XDI3498I      *ddname* REFRESHES=*nnnnnnnn*; USER=*userid*; DATE=*yyddd*; TIME=*hh:mm***

Explanation: You issued a DISPLAY REFRESH STATS command.

System response: The system displays all statistics relating to the PDS refresh facility.

- *ddname* is the DD name of the PDS being refreshed (ALL, FONTLIB, FORMDEF, OVERLAY, PAGESEG, PAGEFORM, or PAGEDEF).
- *nnnnnnnn* is the number of times the named PDS has been refreshed.
- *userid* is either OPER or the user ID of the last user who requested a refresh of the named PDS.
- *yyddd* is the Julian date when the last refresh of the named PDS occurred.
- *hh:mm* is the time of day when the last refresh of the named PDS occurred (*hh* is hours, *mm* is minutes).

User action: None required.

**XDI3499I**      *xosfname* **SUBSYSTEM NAME:** *xid*

Explanation:      You issued a DISPLAY SUBSYS command.

System response:      The subsystem name is displayed. Xosfname is the job name of the XOSF started task, and xid is the 1- to 4-character subsystem name.

User action:      None required.

**XDI3500I**      **XOSF SYSTEM LOGGING TURNED** *system status*

Explanation:      You issued the SET SYSTEM LOGGING command.

System response:      The indicated XOSF system logging option is set.

User action:      None required.

**XDI3501I**      **XOSF SHUTTING DOWN**

Explanation:      The XOSF address space has begun shutting down. The shutdown may have been initiated internally or by the user.

System response:      The XOSF address space is terminated.

User action:      If the shutdown is in response to the operator command, the user action is none. If it is system-initiated, check the z/OS console log or XLOG for other error messages immediately preceding this message.

**XDI3502I**      **XOSF SHUTDOWN CANCELLED**

Explanation:      After the system shutdown request was issued, you indicated that XOSF was to continue processing instead of being terminated.

System response:      Processing continues.

User action:      None required.

**XDI3503I**      **TASK:** *printer name status job number job name* **DEVICE:** *printer address/vtam primary lu name vtam secondary lu name (device type)*

Explanation:      You issued a command requesting that XOSF shut down, or an internal error occurred, but the specified printer tasks have not been drained.

System response:      None.

User action:      This message accompanies XDI3504A, asking you to confirm the shutdown.

**XDI3504A**      *system id job name* **CONTINUE WITH XOSF SHUTDOWN?**

Explanation:      XOSF has been requested to shut down. The console operator is asked to confirm the request.

System response:      XOSF waits for the operator's reply.

User action:      Enter **Y** to continue the shutdown, or **N** to cancel the shutdown.

**XDI3505I      XOSF DISPLAY SYSTEM COUNTERS *status***

Explanation:    You issued the DISPLAY SYSTEM COUNTERS command.  
 System response: XOSF displays the system counters.  
 User action:    None required.

**XDI3506I      *name ==> nn name ==> nn.***

Explanation:    You issued the DISPLAY SYSTEM COUNTERS command.  
 System response: XOSF displays the system counters. *Name* is the name of the XOSF counter being displayed. *nn* is the current value of the counter being displayed.  
 User action:    None required.

**XDI3511I      REFRESH REQUEST HAS BEEN POSTED**

Explanation:    You issued the REFRESH command.  
 System response: The request is being processed. Message XDI3407I should follow, indicating the completion of the refresh processing.  
 User action:    None required.

**XDI3512I      REFRESH SPECIFIED IS ALREADY IN PROGRESS**

Explanation:    You issued the REFRESH DDNAME command, but one of these conditions has occurred:

- An XOAF refresh has already been requested.
- A prior refresh operator command has been issued and the BLDL processing has not completed.

System response: The original request is processed, but the duplicate request is not.  
 User action:    If necessary, reissue the request.

**XDI3513W      XDIRFRSH UNABLE TO FIND XSLCB**

Explanation:    You issued the REFRESH command. XPAF encountered an error in processing the XPAF subsystem linkage.  
 System response: Command processing is terminated.  
 User action:    Call Xerox Technical Support.

**XDI3514I      XOSF SYSTEM SMF RECORDING TURNED *smf recording status***

Explanation:    You issued the SET SMF RECORDING command.  
 System response: The specified SMF logging option is set.  
 User action:    None required.

**XDI3516I XOSF TERMINATE TASK REQUEST COMPLETED**

Explanation: You issued the TERMINATE TASK command.  
 System response: The task identified in the command is terminated.  
 User action: None required.

**XDI3517E UNABLE TO OBTAIN A FREE XRQBLK**

Explanation: XOSF was unable to acquire an XRQBLK in response to a TERMINATE TASK command.  
 System response: The task specified in the command remains active.  
 User action: Call Xerox Technical Support.

**XDI3518E ERROR ENCOUNTERED WHILE PROCESSING A TERMINATE TASK REQUEST.  
 RC=return code**

Explanation: You issued the TERMINATE TASK command, but XOSF was unable to terminate the task.  
 System response: The task specified in the command remains active.  
 User action: Call Xerox Technical Support.

**XDI3521E INVALID JES3 CONTROL BLOCK FOR JOB *job name job number* ON *printer name***

Explanation: When opening a JES3 SYSOUT dataset, XOSF encountered an invalid JES3 SRL.  
 System response: The SYSOUT dataset is not printed, and the printer is drained.  
 User action: Ensure installation job UMJOB101 has been run successfully. This job reapplies the XDIOFTAB and must be run after XOSF or JES3 maintenance is applied.  
 If the problem persists after XDIOFTAB has been reapplied successfully, call Xerox Technical Support.

**XDI3522E FSA *request type* REQUEST FAILURE FOR JOB *job name job number* STEP *step name*  
 DDNAME *dataset definition name* ON *printer name*. FSI RC=X'return code'; REASON  
 CODE=X'reason code'**

Explanation: An error occurred on a call to JES through the FSI. The FSA request type is one of these:

|                 |                                      |
|-----------------|--------------------------------------|
| GET RECORD      | Requesting a print record from JES   |
| OOP             | Output on Operator Observation Point |
| RELEASE DATASET | Returning the SYSOUT dataset to JES. |

System response: The FSS request is not fulfilled.  
 User action: If the FSI request is RELEASE DATASET, determine whether the job should be manually released or purged from JES. Call Xerox Technical Support.

**XDI3525W      SSI JES3 S34 GETMAIN FAILED FOR *number* BYTES WITH RC *X'*return code'**

- Explanation: A JES3 SSI request was made but there was insufficient virtual storage available to create the JES3 S34 work area control block.
- System response: The SSI request is bypassed; other XOSF processing continues.
- User action: Increase the value specified for the REGION parameter on the XOSF start-up proc and restart the XOSF address space.

**XDI3526W      SSI JES3 LEVEL *level* UNSUPPORTED**

- Explanation: A JES3 SSI request was made but the version of JES3 running is not supported by XOSF. *Level* is the 6- to 8-character JES3 release, feature, or selectable unit identifier.
- System response: The SSI request is bypassed; other XOSF processing continues.
- Install a level of JES3 that is supported by XOSF. Refer to [Section Two: Installing and Customizing XPAF](#) for the minimum JES levels currently supported by XPAF.

**XDI3527E      SUBSYSTEM NAME *subsystem name* IS NOT ALLOWED FOR XOSF**

- Explanation: The named subsystem specified by the SUBSYS initialization parameter is not allowed for use by XOSF.
- System response: Initialization processing is terminated.
- User action: Specify a valid subsystem name from IEFSSN*nn* for the SUBSYS initialization parameter. Ensure that the subsystem name specified has been specifically designated for use by XOSF.

**XDI3530E      *module* ABENDED IN ROUTINE *routine*. CC=*X'*completion code'**

- Explanation: An abend in XOSF processing was intercepted.
- System response: The task is terminated.
- User action: Call Xerox Technical Support with the module name, routine name, completion code, accompanying dump, and XOSF log.

**XDI3540E      VALIDATION TABLE CORRUPTED. MAX TASK REDUCED BY 1**

- Explanation: A subtask ATTACH was attempted, but no free entries in the subtask table could be found.
- System response: The subtask is not attached. The maximum number of subtasks is reduced by one. XPAF continues processing other tasks.
- User action: Call Xerox Technical Support.

**XDI3541E      UNABLE TO operation PROGRAM program name**

Explanation:      When starting a new subtask, a program to be loaded or attached could not be located.

System response:      The subtask is not loaded or attached. Other tasks continue processing.

User action:      Be sure the named program is either in the XPAF STEPLIB concatenation or in the z/OS link list. Resubmit the subtask start.

**XDI3542E      INSUFFICIENT STORAGE TO START SUBTASK**

Explanation:      Insufficient virtual storage was available to hold the program information parameters while attaching a new subtask.

System response:      The subtask is not attached. Other tasks continue processing.

User action:      Perform one or both of these actions:

- Increase the private region virtual storage available below the 16M line by increasing the value of the REGION parameter on the EXEC statement in the XOSF start-up proc.
- Reduce the number of printers running in the FSS.

If the problem persists, call Xerox Technical Support.

**XDI3543E      ERROR OCCURRED DURING CROSS MEMORY INSTRUCTION**

Explanation:      An error occurred executing a Set Secondary Address Space instruction, a Move to Current Primary instruction, or a Move to Current Secondary instruction while attaching a new subtask.

System response:      The subtask is not attached. Other tasks continue processing.

User action:      Call Xerox Technical Support.

**XDI3544W      UNKNOWN TIMER XRQBLK ON SUBTASK XSTCB**

Explanation:      An invalid entry in the Timer Service queue was found while deleting a subtask.

System response:      Processing continues.

User action:      If the problem persists, call Xerox Technical Support.

**XDI3545W      UNKNOWN ESTAE PROGRAM ON SUBTASK XSTCB**

Explanation:      An error occurred deleting the ESTAE recovery program while deleting a subtask.

System response:      XPAF processing continues.

User action:      If the problem persists, call Xerox Technical Support.

**XDI3546E UNKNOWN UNCHAINED XSTCB**

Explanation: The subtask control block to be unchained could not be located while deleting a subtask.

System response: The subtask is not deleted. XOSF attempts to continue processing other tasks.

User action: Terminate all printer tasks as soon as possible. Stop and restart the XOSF address space. If the problem persists, call Xerox Technical Support.

**XDI3547W SUBTASK LOCK CHAIN CONTAMINATED**

Explanation: An invalid lock queue entry was found while deleting a subtask.

System response: XPAF processing continues.

User action: If the problem persists, call Xerox Technical Support.

**XDI3548E UNABLE TO CLOSE THE LOG DSNAME *dataset name***

Explanation: An unsuccessful attempt was made to close the named log dataset.

System response: Processing continues, but logging is disabled.

User action: Look at the messages that were issued prior to this message to determine the cause of the failure. If further assistance is required, call Xerox Technical Support.

**XDI3549I THE LOG DSNAME WAS SWITCHED FROM *dataset name* TO *dataset name***

Explanation: The "FROM" log dataset was closed. The "TO" log dataset was opened and is the currently active log.

System response: Processing continues.

User action: None required.

**XDI3550W AN ERROR OCCURRED WHEN SWITCHING FROM LOG *dataset name* TO LOG *dataset name*. LOGS NOT SWITCHED**

Explanation: You issued the SWITCH XLOG command, but XEIMAIN could not complete the request successfully.

System response: Processing continues, but the logs are not switched.

User action: Look for the messages that were issued prior to this message to determine the failure. If further assistance is required, call Xerox Technical Support.

**XDI3551E      UNABLE TO REFRESH LOG DSNAME *dataset name***

Explanation:      You issued the REFRESH XLOG command, but XEIMAIN could not complete the request successfully.

System response:      Processing continues, but the named log dataset is not refreshed.

User action:      Look for messages that were issued prior to this message to determine the cause of the failure. If further assistance is required, call Xerox Technical Support.

**XDI3552E      UNABLE TO '*requested action*' BECAUSE XEIMAIN IS DAMAGED**

Explanation:      Either an internal component requested service from XEIMAIN or you issued a command, but XEIMAIN was unable to respond to this request.

System response:      Processing continues, but the request is not processed.

User action:      Look for messages that were issued prior to this message to determine the cause of the failure. If further assistance is required, call Xerox Technical Support.

**XDI3553E      THE XOSF ROUTER FOUND AN INVALID REQUEST BLOCK. RC=X'*return code*'**

Explanation:      While attempting to attach a subtask, XDRTIAS found an invalid request block.

System response:      Processing continues, but the subtask is not started.

User action:      Call Xerox Technical Support.

**XDI3554E      THE XOSF ROUTER FOUND AN INVALID BUFFER ADDRESS IN XRQBLK. RC=X'*return code*'**

Explanation:      While attempting to attach a subtask, XDRTIAS found an invalid buffer address in the XRQBLK.

System response:      Processing continues, but the subtask is not started.

User action:      Call Xerox Technical Support.

**XDI3555E      THE XOSF ROUTER WAS UNABLE TO FIND THE AUTOSTART TABLE. RC=X'*return code*'**

Explanation:      While attempting to attach a subtask, XDRTIAS was unable to find the autostart subtask table.

System response:      Processing is terminated.

User action:      Call Xerox Technical Support.

**XDI3556E THE XOSF ROUTER WAS UNABLE TO FIND THE AUTOSTART MODULE *module name*. TASK NOT STARTED**

Explanation: While attempting to attach a subtask, XDRTIAS was unable to find the named module to be loaded as a subtask.

System response: Processing continues, but the subtask is not started.

User action: Call Xerox Technical Support.

**XDI3596E XDIOFTAB JES LEVEL IS *otab-level* AND DOES NOT MATCH SYSTEM JES LEVEL OF *sys-level***

Explanation: While starting XOSF, it was determined that the level of the operating system JES (*sys-level*) does not match the level of the XOSF offsets table, XDIOFTAB (*otab-level*).

System response: Processing is terminated and the XOSF address space will be shut down.

User action: Re-assemble the XDIOFTAB using current JES and System MACLIBs.

**XDI3597I CPUID=*cpuid***

Explanation: This informational message is displayed at XOSF startup.

System response: Processing continues.

User action: None required.

**XDI3598I XDIOFTAB=*otab-level***

Explanation: This informational message is displayed at XOSF startup.

System response: Processing continues.

User action: None required.

**XDI3599I SYSTEM=*sys-level*, JES2 *jes-level*, XPAF *xpaf-level***

Explanation: This informational message is displayed at XOSF startup and displays the current operating system, JES and XPAF levels.

System response: Processing continues.

User action: None required.

**XDI3614E *printer*: INVALID PPT VALUE (*value*) FOR *parameter*. *action***

Explanation: An invalid value was entered for the specified parameter in the named printer profile.

System response: The *action* indicates whether the printer profile is built. Most invalid values are ignored; however, some result in a "Cannot build PPT" action.

User action: All errors must be corrected. Edit the printer profile and correct the invalid value.

**XDI3615E** *printer: PPT BUILD ERROR: message profile-statement*

- Explanation: The identified *profile-statement* in the specified printer profile contains an error, identified by the *message*.
- System response: Most invalid values are ignored, and the printer profile is built.
- User action: All errors must be corrected to avoid further errors that may occur when you try to print. Edit the printer profile and correct the invalid profile statement.

**XDI3947E** **INVALID JFCB FOUND FOR DDNAME** *ddname*

- Explanation: A pointer from the TIOT to a JFCB was found to have an invalid prefix (C'JFCF' at the displacement 12, decimal). This error occurred while attempting to determine the dataset name(s) associated with a resource PDS *ddname*.
- System response: This DD name is ignored. Attempts to refresh this resource directory by dataset name will fail, and attempts to refresh by DD type will have unpredictable results.
- User action: In the XOSF start-up proc, examine the JCL for this DD. Correct any errors.

**XDI4153E** **MEMBER** *printer* **NOT FOUND IN LIBRARY** *library name*

- Explanation: The named member was not found in the named library.
- System response: A profile is not built for the named printer.
- User action: Add the printer profile member to the library designated on the PROFDD statement in the XINSXOSF member of XINPARM.

**XDI4154E** **LOAD MODULE** *module name* **NOT FOUND**

- Explanation: The named required load module could not be located.
- System response: For errors in XPAF initialization or in the FSS, XPAF is terminated. For errors in all other areas, the printer is drained.
- User action: Ensure all maintenance has been applied successfully and the load library to which the maintenance has been applied is in the XOSF start-up proc STEPLIB concatenation. If the problem persists, call Xerox Technical Support.

**XDI4332E** **THM ERROR DETECTED IN** *module name* **WHILE** *action* **THE** *table name* **TABLE**

- Explanation: During the processing of the JCL keywords for the job, XPAF encountered an error trying to process one of the required tables. *Action* is either OPENING, READING, UPDATING, INSERTING, etc.
- System response: Document processing is terminated.
- User action: This is generally a problem with the allocation of members in the TABLELIB dataset. Verify that XPAF is allocated to the proper dataset and that the required members are present.

**XDI7201E ESTAE FAILURE ON ENTRY TO** *module name*. **RC=X**'return code'; **IC=X**'information code'

Explanation: The XPAF ESTAE routines were unable to complete recovery processing.  
 System response: The task is terminated.  
 User action: Call Xerox Technical Support.

**XDI7202E COULD NOT GET SUFFICIENT MEMORY** *action*

Explanation: A GETMAIN failed because there was insufficient memory.  
 System response: XPAF is not initialized.  
 User action: Increase the region size for XOSF and start XOSF again.

**XDI7211W SAF STATUS REQUEST RETURNED RC=X**'return code'

Explanation: XPAF attempted to perform a security authorization check for a job that either specified the USERLIB IBM JCL keyword on the OUTPUT statement or inserted a USERLIB dataset name via user exit 02. Also, a RACSTAT macro returned a non-zero return code. This message is only issued if intensive logging is turned on.  
 System response: XOSF processing continues. USERLIB security authorization checking is not performed for this job step.  
 User action: If USERLIB security authorization checking is required, ensure that a security package is installed and active at a supported release level. For IBM's RACF, XPAF requires a minimum release level of 1.6. Refer to the IBM publication *External Security Interface Macro Reference for z/OS and VM* for an explanation of the RACSTAT return codes.

**XDI7212W SAF** *action status* **FOR USERID=userid, FOR** (*job number*) (*job name*)

Explanation: XPAF attempted to perform a security authorization check for a job that either specified the USERLIB IBM JCL keyword on the OUTPUT statement or inserted a USERLIB dataset name via user exit 02. Also, a RACROUTE macro returned a non-zero return code. This message is only issued if intensive logging is turned on.  
 System response: XOSF processing continues.  
 User action: See message XDI7213W to obtain the SAF return code, the RACF return code, and the RACF reason code. Refer to the IBM publication *External Security Interface Macro Reference for z/OS and VM* for an explanation of these codes.

**XDI7213W**     **SAF RC=X'saf return code'; RACF RC=X'racf return code'; RACF REASON CODE=X'racf reason code', FOR RACROUTE REQUEST=action**

Explanation:     XPAF attempted to perform a security authorization check for a job that either specified the USERLIB IBM JCL keyword on the OUTPUT statement or inserted a USERLIB dataset name via user exit 02. Also, a RACROUTE macro returned a non-zero return code. This message is only issued if intensive logging is turned on.

System response:     XOSF processing continues.

User action:     Refer to the IBM publication *External Security Interface Macro Reference for z/OS and VM* for an explanation of these codes.

**XDI7214E**     **SAF action status FOR USERID=userid, FOR (job number) (job name)**

Explanation:     XPAF attempted to perform a security authorization check for a job that either specified the USERLIB IBM JCL keyword on the OUTPUT statement or inserted a USERLIB dataset name via user exit 02. Also, a RACROUTE macro returned a non-zero return code.

System response:     The document is queued on hold and marked as unprintable by XPAF.

User action:     See message XDI7215E for the SAF return code, the RACF return code, and the RACF reason code. Refer to the IBM publication *External Security Interface Macro Reference for z/OS and VM* for an explanation of these codes.

**XDI7215E**     **SAF RC=X'saf return code'; RACF RC=X'racf return code'; RACF REASON CODE=X'racf reason code', FOR RACROUTE REQUEST=action**

Explanation:     XPAF attempted to perform a security authorization check for a job that either specified the USERLIB IBM JCL keyword on the OUTPUT statement or inserted a USERLIB dataset name via user exit 02. Also, a RACROUTE macro returned a non-zero return code.

System response:     The document is queued on hold and marked as unprintable by XPAF.

User action:     Refer to the IBM publication *External Security Interface Macro Reference for z/OS and VM* for an explanation of these codes.

**XDI7216W**     **SAF REQUESTED FUNCTION BYPASSED FOR USERID=userid, FOR USERLIB='userlib dataset name'**

Explanation:     XPAF attempted to perform a security authorization check for a job that either specified the USERLIB IBM JCL keyword on the OUTPUT statement or inserted a USERLIB dataset name via user exit 02. Also, a RACROUTE REQUEST=AUTH macro returned an SAF return code of 4. This message is only issued if intensive logging is turned on.

System response:     XOSF processing continues.

User action:     See message XDI7213W for the SAF return code, the RACF return code, and the RACF reason code. Refer to the IBM publication *External Security Interface Macro Reference for z/OS and VM* for an explanation of these codes.

**XDI7217E      USERID=*userid* IS NOT AUTHORIZED BY SAF TO ACCESS USERLIB='*userlib dataset name*'**

Explanation:      XPAF attempted to perform a security authorization check for a job that either specified the USERLIB IBM JCL keyword on the OUTPUT statement or inserted a USERLIB dataset name via user exit 02. Also, a RACROUTE REQUEST=AUTH macro returned an SAF return code greater than 4.

System response:      The document is queued on hold and marked as unprintable by XPAF.

User action:      Verify that the user is authorized to access the dataset. See message XDI7215E for the SAF return code, the RACF return code, and the RACF reason code. Refer to the IBM publication *External Security Interface Macro Reference for z/OS and VM* for an explanation of these codes.

**XDI7218W      SAF REQUESTED FUNCTION BYPASSED FOR USERID=*userid*, FOR (*job number*) (*job name*)**

Explanation:      XPAF attempted to perform a security authorization check for a job that either specified the USERLIB IBM JCL keyword on the OUTPUT statement or inserted a USERLIB dataset name via user exit 02. Also, either a RACSTAT macro returned a non-zero return code or a RACROUTE REQUEST=VERIFY macro returned an SAF return code of 4. This message is only issued if intensive logging is turned on.

System response:      XOSF processing continues.

User action:      See message XDI7211W for the RACSTAT return code, or message XDI7213W for the SAF return code, the RACF return code, and the RACF reason code. Refer to the IBM publication *External Security Interface Macro Reference for z/OS and VM* for an explanation of these codes.

**XDI7219E      SAF REQUESTED FUNCTION FAILED FOR USERID=*userid*, FOR (*job number*) (*job name*)**

Explanation:      XPAF attempted to perform a security authorization check for a job that either specified the USERLIB IBM JCL keyword on the OUTPUT statement or inserted a USERLIB dataset name via user exit 02. Also, a RACROUTE REQUEST=VERIFY macro returned an SAF return code greater than 4.

System response:      The document is queued on hold and marked as unprintable by XPAF.

User action:      See message XDI7215E for the SAF return code, the RACF return code, and the RACF reason code. Refer to the IBM publication *External Security Interface Macro Reference for z/OS and VM* for an explanation of these codes.

**XDI7220E**      *(job number) (job name)* **ENCOUNTERED A CATALOG ACCESS ERROR FOR USERLIB='userlib dataset name'**

- Explanation: XPAF attempted to locate a USERLIB dataset for a job that either specified the USERLIB IBM JCL keyword on the OUTPUT statement or inserted a USERLIB dataset name via user exit 02. Also, the LOCATE macro returned a non-zero return code.
- System response: The document is queued on hold and marked as unprintable by XPAF.
- User action: Verify that the USERLIB dataset is cataloged. See message XDI7221E for the LOCATE return code. Refer to the IBM publication *z/OS/DFP System Programming Reference* for an explanation of these codes.

**XDI7221E**      **CATALOG ACCESS RC=X'return code'**

- Explanation: XPAF attempted to locate a USERLIB dataset for a job that either specified the USERLIB IBM JCL keyword on the OUTPUT statement or inserted a USERLIB dataset name via user exit 02. Also, the LOCATE macro returned a non-zero return code.
- System response: The document is queued on hold and marked as unprintable by XPAF.
- User action: Verify that the USERLIB dataset is cataloged. See message XDI7220E for the dataset name. Refer to the IBM publication *z/OS/DFP System Programming Reference* for an explanation of the LOCATE return codes.

**XDI7501E**      **LDM command ERROR. EC=X'error code'**

- Explanation: During checkpoint or USERLIB processing, an error was detected trying to access one of the required PDS libraries.
- System response: Document processing is terminated.
- User action: Verify that the required libraries are allocated and available to XPAF. If you believe you are receiving this message in error, call Xerox Technical Support.

**XDI7503I**      **DATASET REPOSITIONING IN PROGRESS. activity REQUEST IGNORED**

- Explanation: A spacing request was received before a previous spacing request completed. *Activity* indicates a JES command to forward space or backspace a document.
- System response: Request is ignored.
- User action: Verify that the previous spacing request has completed, then reinitiate the JES command.

**XDI7504E**      **COMSSID=subsystem id SPECIFIES AN INVALID SUBSYSTEM NAME**

- Explanation: The subsystem name was not found in the subsystem name table.
- System response: XPAF terminates.
- User action: Change the COMSSID= in XINPARMS to an existing subsystem, or, add the subsystem name to the subsystem name table.

## XDS messages

---

### XDS1000I      SUBSYSTEM ACTIVE

- Explanation: The XDS subsystem is active and ready to process print data from batch jobs or started tasks and to check the syntax of JCL submitted to JES that specifies the XDS subsystem name in the SUBSYS DD parameter.
- System response: A start command is issued for the XOSF subsystem that is associated with XDS.
- User action: Jobs specifying the XDS subsystem can be submitted to JES. After the XOSF FSS connect message is issued, XDS jobs can be executed.

### XDS1001I      SUBSYSTEM INACTIVE

- Explanation: The XDS subsystem has terminated.
- System response: None.
- User action: Do not submit any jobs that specify the XDS subsystem.
- User action: If there are jobs already submitted that specify the XDS subsystem, place them on hold until the XDS subsystem is restarted.

### XDS1002E      SUBSYSTEM INITIALIZATION ABENDED

- Explanation: An abend occurred while XDS was initializing the subsystem interface.
- System response: All common storage areas are freed. XDS is not initialized.
- User action: Call Xerox Technical Support.

### XDS1003E      *module name* STORAGE FOR REENTRANT WORK AREA UNAVAILABLE

- Explanation: Insufficient virtual storage was available to XDS in the private region.
- System response: The XDS function being performed is terminated.
- User action: Increase the region parameter on the EXEC statement of the JCL for the batch job or started task that issued the message. After increasing the region size, resubmit the print job.
- User action: If the error occurred during XDS or XOSF initialization, follow the XDS recovery procedures documented in [Section Four: Printing Documents with XPAF](#). If the problem persists, call Xerox Technical Support.

#### **XDS1004E STORAGE FOR SSVT UNAVAILABLE**

- Explanation: Insufficient CSA virtual storage was available to XDS below the 16M line. Either CSA fragmentation occurred or the size of the CSA is insufficient for the number of tasks being run.
- System response: XDS initialization is terminated. XOSF is not started.
- User action: If the CSA is not fragmented, increase the CSA size as defined by the CSA parameter in SYS1.PARMLIB(IEASYSxx). IPL the system.
- For additional information on defining CSA size, refer to the z/OS *Initialization and Tuning Reference*.

#### **XDS1005E *module name* ERROR DURING LOAD SSI/FSI FUNCTION ROUTINES**

- Explanation: XDS was unable to locate all the required XDS load modules in the z/OS link list.
- System response: For SSI routines, the XDS subsystem initialization is terminated. XOSF is not started. For FSI routines, XOSF initialization is terminated.
- User action: Terminate XOSF by issuing one of these commands:
- SYSTEM SHUTDOWN  
STOP *xdsname*
- Ensure all XDS load modules have been installed correctly in the z/OS link list. If maintenance has been applied recently, ensure that the z/OS link list address space has been refreshed. Issue the START *xdsstart* command to restart XDS, where *xdsstart* is the name of the XDS start-up proc in your JES-controlled PROCLIB.

#### **XDS1006E STORAGE FOR SSI FUNCTION ROUTINES UNAVAILABLE**

- Explanation: Insufficient CSA virtual storage was available to XDS below and above the 16M line. Either CSA fragmentation occurred or the size of the CSA is insufficient for the number of tasks being run.
- System response: XDS initialization is terminated. XOSF is not started.
- User action: If the CSA is not fragmented, increase the CSA size as defined by the CSA parameter in SYS1.PARMLIB(IEASYSxx). IPL the system.
- For additional information on defining CSA size, refer to z/OS *Initialization and Tuning Reference*.

#### **XDS1007E ERROR STARTING SUBSYSTEM ADDRESS SPACE**

- Explanation: z/OS was unable to process the START command for XOSF.
- System response: XDS subsystem initialization is terminated. XOSF is not started.
- User action: Call Xerox Technical Support.

**XDS1008E**     *module name* **ESTAE ERROR**

Explanation:     XDS was unable to establish an ESTAE abend recovery exit.  
 System response:     The XDS function being performed is terminated.  
 User action:     Call Xerox Technical Support.

**XDS1009E**     *module name* **SUBSYSTEM FUNCTION ROUTINE ABENDED**

Explanation:     An abend occurred while XDS was performing a subsystem function.  
 System response:     XDS recovers and attempts to clean up the SSI or FSI environment. For modules with names beginning with XDSFN or XDSSS, the print application running as an XDS batch job or started task is terminated with an error. For module names beginning with XDSFA or XDSFS, XOSF is terminated.  
 User action:     For modules names beginning with XDSFA or XDSFS, follow the XDS recovery procedures documented in [Section Four: Printing Documents with XPAF](#). If the problem persists, call Xerox Technical Support.

**XDS1010E**     **SUBSYSTEM ADDRESS SPACE NOT ACTIVE**

Explanation:     An FSI order was issued to XOSF or an XOSF command was issued using the XDS subsystem command character. The XOSF address space has terminated after the command or order was issued but before the request could be completed.  
 System response:     The response differs by type of request:  
     • For commands, the command is ignored.  
     • For FSI disconnect orders, processing continues.  
     • For all other FSI orders, the print application running as a XDS batch job or started task is terminated with an error.  
 User action:     Check the XOSF log for error messages and follow the action documented in the XOSF message.

**XDS1011E**     *module name* **SUBSYSTEM ROUTINE ABENDED** *abend code*

Explanation:     An abend occurred while XDS was performing a subsystem function.  
 System response:     The XDS print application running as a batch job or started task is terminated with an error.  
 User action:     Call Xerox Technical Support.

**XDS1012E    INVALID SUBSYSTEM PARMS FOR FUNCTION** *subsystem function number*

- Explanation: A subsystem request that specified invalid input parameters was issued to XDS.
- System response: The response differs by function number:
- For functions 6, 7, and 16, the print application running as an XDS batch job or started task abends with an S013.
  - For function 17, the print application running as an XDS batch job or started task abends with an S014.
  - For function 38, the print application running as an XDS batch job or started task is terminated with a JCL error.
  - For function 53 from XOSF at FSS initialization, XOSF processing is terminated.
  - For function 53 from XOSF at printer initialization, the print application running as an XDS batch job or started task is terminated with an error.
  - For function 255, an XDS command was issued by the operator. The command is ignored.
- User action: The action differs by function number:
- For function 53 from XOSF at FSS initialization, follow the XDS recovery procedures documented in [Section Four: Printing Documents with XPAF](#). If the problem persists, call Xerox Technical Support.
  - For all functions, including function 53, call Xerox Technical Support.

**XDS1013E    FSI CALLER NOT AUTHORIZED**

- Explanation: XDS has received a request from XOSF, but XOSF is not APF-authorized.
- System response: The request from XOSF is not processed. The XDS print application running as an XDS batch job or started task is terminated with an error.
- User action: Verify that the XOSF load library name and volume serial number are correct in SYS1.PARMLIB(IEAAPFxx). Correct as necessary. If you made changes to SYS1.PARMLIB(IEAAPFxx), IPL the system. If the problem persists, call Xerox Technical Support.

**XDS1014E    FSS ALREADY ACTIVE**

- Explanation: An attempt to restart the XDS subsystem was made before the XOSF connected to a previously active XDS subsystem completed termination processing.
- System response: XOSF is not restarted. The XDS subsystem is not initialized properly.
- User action: Terminate XOSF. XOSF will perform its own recovery if the XOSF ESTAE initialization parameter specifies Y. Stop XDS. After XOSF recovery is complete, restart XDS. Refer to the XDS recovery procedures documented in [Section Four: Printing Documents with XPAF](#).

#### **XDS1015E STORAGE FOR FSI VECTOR TABLE UNAVAILABLE**

Explanation: Insufficient virtual storage was available to XDS in the XOSF address space private region.

System response: XOSF is not started. The XDS subsystem is not initialized properly.

User action: Terminate XOSF. XOSF will perform its own recovery if the XOSF ESTAE initialization parameter specifies Y. Stop XDS. Increase the region parameter on the EXEC statement in the XOSF start-up proc or increase the value for the XOSF XCORE initialization parameter. After XOSF recovery is complete, restart XDS.

#### **XDS1016E LINKAGE INDEX ERROR**

Explanation: XDS was unable to obtain a cross memory linkage index.

System response: XOSF is not started. The XDS subsystem is not properly initialized.

User action: Terminate XOSF. XOSF will perform its own recovery if the XOSF ESTAE initialization parameter specifies Y. Stop XDS. Call Xerox Technical Support.

#### **XDS1017E ERROR DURING LOAD FSI X-MEM ROUTINES**

Explanation: XDS was unable to locate the functional subsystem cross memory Program Call (PC) instruction program.

System response: XOSF is not started. The XDS subsystem is not properly initialized.

User action: Terminate XOSF by issuing one of these commands:

SYSTEM SHUTDOWN  
STOP *xdsname*

Ensure all XDS load modules have been installed correctly in the z/OS link list. If maintenance has been applied recently, ensure that the z/OS link list address space has been refreshed. Issue the START *xdsstart* command to restart XDS, where *xdsstart* is the name of the XDS start-up proc in your JES-controlled PROCLIB.

#### **XDS1018E ENTRY TABLE ERROR**

Explanation: XDS was unable to create an entry in the cross memory entry table.

System response: XOSF is not started. The XDS subsystem is not initialized properly.

User action: Terminate XOSF. XOSF will perform its own recovery if the XOSF ESTAE initialization parameter specifies Y. Stop XDS. Call Xerox Technical Support.

#### **XDS1019E     AUTHORITY INDEX ERROR**

Explanation:     XDS was unable to extract the XOSF authority index, or was unable to create a new cross memory authority index.

System response:     XOSF is not started. The XDS subsystem is not initialized properly.

User action:     Terminate XOSF. XOSF will perform its own recovery if the XOSF ESTAE initialization parameter specifies Y. Stop XDS. Call Xerox Technical Support.

#### **XDS1020E     INVALID COMMAND**

Explanation:     An XDS operator command was entered with an invalid or unrecognized command verb.

System response:     The command is ignored.

User action:     Reenter the command with the correct verb.

#### **XDS1021E     SUBSYSTEM INITIALIZATION FAILED**

Explanation:     The input parameters on the EXEC statement of the XDSSTART start-up proc are invalid.

System response:     The XOSF START command is not issued.

Correct the input parameters on the EXEC statement. For more information, refer to [Section Two: Installing and Customizing XPAF](#).

#### **XDS1030E     *module name* FUNCTIONAL SUBSYSTEM ROUTINE ABENDED**

Explanation:     An abend occurred while XDS was executing in the XOSF address space.

System response:     For an FSS level error, XOSF is terminated.

For a printer task error, the print application running as an XDS batch job or started task is terminated with an error.

User action:     For an FSS level error, follow the XDS recovery procedures documented in [Section Four: Printing Documents with XPAF](#).

For an FSS level or printer task error, call Xerox Technical Support.

#### **XDS1031A     SET UP *printer name* WITH *form name* FORMS FOR JOB *job name***

Explanation:     A notification of a change in forms was requested by the SETUP initialization or printer profile parameter.

System response:     Printing is suspended by XOSF awaiting operator action. The print application running as an XDS batch job or started task also waits.

User action:     Load the printer with the requested forms. Restart the printer by issuing the START PRT*nnnn* command.

**XDS1050E UNKNOWN FSI FUNCTION**

Explanation: XOSF sent the XDS subsystem an undefined or unrecognized FSI request.

System response: The request is ignored.

User action: Call Xerox Technical Support.

**XDS1051E *module name* INVALID PRINTER NAME**

Explanation: The printer name specified in the SUBSYS parameter of the print dataset DD statement is not between one and eight characters in length or does not start with an alphanumeric character.

System response: The print application running as an XDS batch job or started task is terminated with a JCL error.

User action: Correct the spelling of the printer name and resubmit the job.

**XDS1052E *module name* EXCESSIVE SUBSYSTEM PARAMETERS**

Explanation: More parameters were specified on the SUBSYS parameter of the print dataset DD statement than the XDS subsystem supports.

System response: The print application running as an XDS batch job or started task is terminated with a JCL error.

User action: Remove the extraneous parameters from the SUBSYS parameter of the print dataset DD statement and resubmit the job.

**XDS1053E *module name* MISSING SUBSYSTEM PARM**

Explanation: The printer name for the XDS job was not found on the SUBSYS parameter of the print dataset DD statement.

System response: The print application running as an XDS batch job or started task is terminated with a JCL error.

User action: Specify the printer name for the XDS job on the SUBSYS parameter of the print dataset DD statement and resubmit the job.

**XDS1054E *module name* INVALID SEP KEYWORD**

Explanation: The operand of the SEP keyword on the SUBSYS parameter of the print dataset DD statement is omitted or invalid.

System response: The print application running as an XDS batch job or started task is terminated with a JCL error.

User action: Correct the SEP operand and resubmit the job. Refer to the valid values and their descriptions as documented in [Section Four: Printing Documents with XPAF](#).

**XDS1055E      UNSUPPORTED SUBSYSTEM FUNCTION** *function number*

Explanation:      The XDS subsystem received a subsystem request that is not supported by XDS.

System response:      The request is not processed. An error return code is sent to the requester in the SSOB. The print application running as an XDS batch job or started task is terminated.

User action:      Call Xerox Technical Support.

**XDS1056E      *module name* INVALID SUBSYSTEM PARMS**

Explanation:      The XDS subsystem received a subsystem request that had invalid input parameters or required input parameters that could not be located.

System response:      The request is not processed. An error return code is sent to the requester in the SSOB.

                            The print application running as an XDS batch job or started task is terminated.

User action:      Call Xerox Technical Support.

**XDS1057E      *module name* FSI ENVIRONMENT ERROR**

Explanation:      While processing a subsystem request for a batch job or started task that specified the XDS subsystem, one of these errors occurred:

- The XOSF address space was not running.
- XOSF had an error that prevented it from communicating further with the XDS subsystem.
- The XOSF printer task was terminating.
- The XOSF FSS was terminating.

System response:      The print application running as an XDS batch job or started task is terminated.

User action:      Check the XOSF log for error messages and follow the actions documented in the XOSF messages.

**XDS1058E      *module name* ERROR LOADING SS SERVICE ROUTINE**

Explanation:      XDS was unable to locate all the required XDS SSI support load modules in the z/OS link list.

System response:      The print application running as an XDS batch job or started task is terminated.

User action:      Ensure all XDS load modules have been correctly installed in the z/OS link list.

                            If XDS maintenance has been applied recently, ensure that the z/OS link list has been refreshed.

                            Resubmit the job.

**XDS1059E**     *module name* **CROSS MEMORY ERROR**

Explanation: XDS encountered an error in establishing cross memory communication from the batch job or started task that specified the XDS subsystem in the XOSF address space.

System response: The print application running as an XDS batch job or started task is terminated.

User action: Call Xerox Technical Support.

**XDS1060E**     **INVALID DD REQUEST PARMS**

Explanation: During allocation processing for the batch job or started task specifying the XDS subsystem, either the DD name was omitted, or required input parameters from z/OS allocation could not be located.

System response: The print application running as an XDS batch job or started task is terminated with a JCL error.

User action: Ensure the DD statement for the job contains a DD name. Resubmit the job. If the DD statement contains a valid DD name, call Xerox Technical Support.

**XDS1061E**     *printer name* **ALLOCATED TO ANOTHER FSA**

Explanation: The print application running as an XDS batch job or started task specified a printer that is already in use by another XDS application.

System response: The print application running as an XDS batch job or started task is terminated with a JCL error.

User action: Schedule the job to run when the specified printer is free. Resubmit the job.

**XDS1062A**     **JOB** *job name* **WAITING ON** *fss name* **FSS. REPLY WAIT OR CANCEL**

Explanation: The print application running as a batch job or started task has been waiting for a response from XOSF for over three minutes.

System response: The print application running as a batch job or started task waits for a reply from the operator.

User action: To continue to wait for XOSF to respond, enter **WAIT** or **W**. If XOSF does not respond within another three minutes, this message is repeated.

To terminate the print application running as an XDS batch job or started task, enter **CANCEL** or **C**.

**XDS1063W**     **INVALID REPLY**

Explanation: The operator responded to message XDS1062A with an unrecognized reply.

System response: Message XDS1062A is reissued.

User action: Reply with one of the values in the User action description of message XDS1062A.

#### **XDS1064E      MAXIMUM NUMBER OF FSAS EXCEEDED**

- Explanation: An attempt was made by a single XDS subsystem to start more than 24 XDS jobs concurrently.
- System response: The print application running as an XDS batch job or started task is terminated with a JCL error.
- User action: There are two options:
- For each XDS subsystem, define 24 or fewer printer definitions in its associated XOSF.
  - Schedule XDS jobs so that no more than 24 run at any one time.

#### **XDS1065E      START FSA ERROR FOR *printer name***

- Explanation: XOSF was unable to start an FSA task for the printer.
- System response: The print application running as an XDS batch job or started task is terminated with a JCL error.
- User action: Check the XOSF log for error messages and follow the action documented for the message(s).

#### **XDS1066E      TIMER ERROR**

- Explanation: XDS encountered an z/OS timer services error while performing cross memory printer allocation, cross memory printer close, cross memory printer deallocation, or printer setup.
- System response: The print application running as an XDS batch job or started task is terminated. The status of XOSF is unpredictable.
- User action: Stop XOSF and XDS. Call Xerox Technical Support.

#### **XDS1067E      MISSING RECORD LENGTH**

- Explanation: The LRECL value was not specified for the dataset to be printed. This error was detected during dataset OPEN processing.
- System response: The print application running as an XDS batch job or started task is terminated with an S013 abend.
- User action: Be sure the LRECL value is specified in one of these places:
- The DCB parameter in the DD statement
  - The DCB or ACB macro within the print application program

#### **XDS1068E    INVALID BLOCK SIZE**

- Explanation: An invalid block size was found at dataset OPEN in the DCB or ACB.
- System response: The print application running as an XDS batch job or started task is terminated with an S013 abend.
- User action: A correct block size for the DCB or ACB is an even multiple of LRECL for Fixed Block format or at least four bytes larger than LRECL for Variable Block format.
- Correct the block size in these places:
- The DCB parameter in the DD statement
  - The DCB or ACB macro within the print application program

#### **XDS1069E    INVALID DATASET ORGANIZATION**

- Explanation: For the print application running as an XDS started task or batch job, an unsupported dataset organization was found at dataset OPEN. XDS supports only BSAM and QSAM access methods. The dataset organization must be PS.
- System response: The print application running as an XDS batch job or started task is terminated with an S013 abend.
- User action: Specify PS for the dataset organization in these places:
- The DCB parameter in the DD statement
  - The DCB or ACB macro within the print application program

#### **XDS1070E    INVALID RECORD FORMAT**

- Explanation: An unsupported record format was found at dataset OPEN in the DCB or ACB for the print application running as an XDS batch job or started task. XDS supports these formats: Fixed, Fixed Block, Variable, and Variable Block. XDS does not support Undefined and Variable Block Spanned formats.
- System response: The print application running as an XDS batch job or started task is terminated with an S013 abend.
- User action: Specify a record format supported by XDS in these places:
- The DCB parameter in the DD statement
  - The DCB or ACB macro within the print application program

#### **XDS1071E    GETMAIN FAILED FOR SAMSI WORK AREA**

- Explanation: Insufficient private region virtual storage was available to XDS below the 16M line.
- System response: The print application running as an XDS batch job or started task is terminated with an S013 abend.
- User action: Increase the value specified for the REGION parameter on the EXEC statement of the print application JCL for the batch job or started task. After increasing the region size, resubmit the job.

## **XDS1072E FSA ERROR**

- Explanation: An error occurred in the XOSF FSA task or elsewhere in XOSF. This occurred after the XDS subsystem successfully connected to the XOSF FSA at allocation time but before dataset OPEN in the print application running as an XDS batch job or started task.
- System response: The print application running as an XDS batch job or started task is terminated with an S013 abend.
- User action: Check the XOSF log for error messages and follow the action documented in the XOSF messages.

## **XDS1073E FSA SHUTDOWN IN PROGRESS**

- Explanation: The XOSF printer task was:
- Interrupted by the operator
  - Terminated due to an XOSF error
- This occurred after the XDS subsystem successfully connected to the XOSF FSA at allocation time, but before dataset OPEN occurred in the batch job or started task that specified the XDS subsystem.
- System response: The print application running as an XDS batch job or started task is terminated with an S013 abend.
- User action: If the printer task was interrupted by the operator, follow the XDS recovery procedures documented in [Section Four: Printing Documents with XPAF](#). After XDS is restarted, resubmit the job.

## **XDS1074E FSA GDS PROCESSING SEQUENCE ERROR**

- Explanation: The XOSF printer task issued two consecutive FSA GET DATASET requests without an intervening RELEASE DATASET request.
- System response: The print application running as an XDS batch job or started task is terminated with an S013 abend.
- User action: Call Xerox Technical Support.

## **XDS1075 DAMAGED SYSTEM CLOCK**

- Explanation: XDS encountered a system clock hardware error while performing dataset OPEN for a batch job or started task that specified the XDS subsystem.
- System response: The batch job or started task specifying the XDS subsystem is terminated with an S013 abend.
- User action: Correct the system clock error. Resubmit the job.

## **XDS1076E XDSSSPUT SAMS PUT ROUTINE ABENDED *abend code***

- Explanation: An abend occurred while XDS was performing a QSAM PUT or BSAM WRITE request. XDS was able to perform cleanup for the SSI.
- System response: The print application running as a batch job or started task is terminated with an S001 abend.
- User action: Call Xerox Technical Support.

**XDS1077E SJF ERROR REASON CODE** *return code*

- Explanation: An error occurred processing OUTPUT JCL statements for the print application running as an XDS batch job or started task.
- System response: The print application running as an XDS batch job or started task is terminated with an S013 abend.
- User action: If the DD statement containing the SUBSYS parameter also refers to any XPAF extended JCL, be sure XPAFJCL has been installed successfully on the system.
- If XOSF maintenance has been applied for XPAF extended JCL support, be sure the corresponding maintenance to XDS has also been applied and the z/OS link list has been refreshed. Resubmit the job. If the error persists, call Xerox Technical Support.

**XDS1078E OUTPUT JCL KEYWORDS EXCEED TU TABLE SIZE**

- Explanation: The sum of the lengths of all OUTPUT statement parameter operands contained in the DD statement for the XDS print job is larger than the maximum XDS supports.
- System response: The print application running as an XDS batch job or started task is terminated with an S013 abend.
- User action: If XOSF maintenance has been applied for XPAF extended JCL support, be sure the corresponding maintenance to XDS has been applied and the z/OS link list has been refreshed. Remove unnecessary or redundant OUTPUT statement parameters or use abbreviations for the parameter operands. Resubmit the job.
- If the length of the OUTPUT statement cannot be reduced, call Xerox Technical Support.

**XDS1080E AN ERROR OCCURRED IN XOSF, DOCUMENT ABORTED**

- Explanation: An exception error has occurred in XOSF.
- System response: The print application running as an XDS batch job or started task is terminated with a non-zero return code.
- User action: Check the XOSF log and/or the system log to determine what caused the document to terminate. Correct the error, then resubmit the job.

**XDS1081E NO EXLST ADDRESS PROVIDED BY USER**

- Explanation: The user specified the DCB EXLST parameter and coded EXLST code X'09' on the EXLST parameter list in the print application indicating XOSF low-level message handling via an exit routine, but the address of this routine was never loaded into the EXLST parameter list.
- System response: Processing continues, and the low-level XOSF message is passed back to the print application via WTO.
- User action: Verify that the message exit routine address is loaded into the EXLST parameter list. Reassemble and link the user print application, and rerun the job.

**XDS1090W    SUBSYSTEM NOT DEFINED**

Explanation:    An attempt was made to terminate an XDS subsystem that had not been defined to z/OS.

System response:    The request is ignored.

User action:    Be sure the parameter on the EXEC statement of the XDSSTOP proc specifies the correct XDS subsystem name.

**XDS1091W    SUBSYSTEM STORAGE NOT FREED**

Explanation:    Freemain errors occurred during XDS subsystem termination.

System response:    The XDS subsystem control blocks and/or load modules are not freed from CSA SUBPOOL 241. XDS subsystem termination continues.

User action:    If this problem persists, schedule an IPL before CSA becomes exhausted or too fragmented. Call Xerox Technical Support.

**XDS1092E    MSTR SUBSYSTEM COMMUNICATION ERROR. RC=*return code***

Explanation:    The master subsystem encountered an error verifying the existence of the XDS subsystem during XDS subsystem termination.

System response:    The XDS subsystem is not terminated.

User action:    Call Xerox Technical Support.

**XDS1093E    SUBSYSTEM TERMINATION ABENDED**

Explanation:    A recoverable abend occurred during XDS subsystem termination.

System response:    The XDS subsystem is not terminated.

User action:    Follow the XDS recovery procedures documented in [Section Four: Printing Documents with XPAF](#). If the problem persists, call Xerox Technical Support.

**XDS1094E    FSA STILL ACTIVE**

Explanation:    The operator attempted to stop XOSF while an XOSF printer task was still processing a print application running as an XDS batch job or started task.

System response:    The XDS subsystem is not terminated. XOSF termination continues.

User action:    Follow the XDS recovery procedures documented in [Section Four: Printing Documents with XPAF](#). Check the XOSF log for error messages and follow the user action documented for the message(s). Call Xerox Technical Support.

**XDS1095E FSS STILL ACTIVE**

Explanation: The operator attempted to stop XOSF while the FSS was actively processing another XDS subsystem request.

System response: The XDS subsystem is not terminated.

User action: Follow the XDS recovery procedures documented in [Section Four: Printing Documents with XPAF](#). Ensure that there is no outstanding XDS activity before stopping XOSF.

**XDS1096E FSS ALREADY DISCONNECTED**

Explanation: The operator attempted to terminate XOSF a second time after the first termination attempt successfully disconnected the FSS from the XDS subsystem, but before the XDS subsystem terminated and/or the XOSF address space ended.

System response: The XOSF FSS is not disconnected. The XDS subsystem is not terminated.

User action: Follow the XDS recovery procedures documented in [Section Four: Printing Documents with XPAF](#).

**XDS1097E NOT FULL FUNCTION XDS SUBSYSTEM**

Explanation: The operator attempted to terminate an XDS subsystem subset, which only checks JCL syntax.

System response: The XDS subsystem subset is not terminated.

User action: To terminate the XDS subsystem subset, IPL z/OS.

**XDS1098I** *control block name*

Explanation: The DISPLAY XDS command, which displays XDS control blocks, was entered. This message identifies the control block whose contents follow in message XDS1099I. This message is repeated for each control block displayed.

System response: None.

User action: None required.

**XDS1099I** *beginning address storage word storage word storage word storage word character representation*

Explanation: The DISPLAY XDS command, which displays XDS control blocks, was entered. This message displays four words of storage contained in the control block identified in the preceding XDS1098I message. The message is repeated as many times as required to display the entire control block. If the control block is not an even multiple of four words, the final display line will contain all zeros to the right of the last byte of the control block.

System response: None.

User action: None required.

## XEI messages

---

### **XEI0001I      UNABLE TO RELEASE STORAGE DURING XPAF SHUTDOWN WHILE PROCESSING MODULE XEISUFF**

OR

### **UNABLE TO RELEASE LDM COMMON STORAGE WHILE PROCESSING MODULE XEISUFF**

Explanation: This is an internal error.

System response: Document processing continues.

User action: None required. If the problem persists, call Xerox Technical Support.

### **XEI2601I      SWITCHING XLOG FROM *xlog dataset name* TO *alog dataset name***

Explanation: XOSF was writing to or closing the XOSF log dataset and encountered a D37 abend. You specified an alternate XOSF log dataset and ESTAE recovery.

System response: XOSF stops logging to the XLOG and continues logging operations using the alternate log.

User action: Print and clear the XLOG dataset.

### **XEI2602W      ERROR DURING XLOG I/O OPERATIONS. XLOG FUNCTION DISABLED**

Explanation: XOSF was attempting to switch from the current log to the alternate log due to an out-of-space condition on the current log. However, it encountered one of these conditions:

- An out-of-space condition also existed on the alternate log.
- There was an I/O error on the alternate log.
- XOSF could not locate the alternate log.

System response: All logging to the current log and alternate log is terminated.

User action: Print and clear the alternate and/or current log datasets, then issue the SET XOSF LOGGING ON command to restart logging.

### **XEI3010F      COULD NOT GET X'*value*' BYTES OF MEMORY OBTAIN STORAGE REQUEST**

Explanation: A GETMAIN request could not allocate storage above the 16M line. XOSF attempted to acquire an additional storage area and space was not available. This condition is most likely to occur when many printers are processing jobs containing forms. This message is written only on the z/OS log.

System response: Processing is terminated, and the job is requeued.

User action: If the problem persists, increase the value specified for the REGION parameter on the XOSF start-up proc to a value that allows at least 8M additional above-the-line storage.

**XEI3011E**      **COULD NOT RELEASE X'*amount*' BYTES OF MEMORY FROM LOCATION X'*address*'**  
*activity*

Explanation:      This is an internal error.

System response:      Document processing continues.

User action:      None required. If the problem persists, call Xerox Technical Support.

**XEI3301F**      **SUPPORT MODULE NAME INVALID IN XEILoad, XOSF ABORTED. RC=X'*return code*'**

Explanation:      XOSF attempted to load all XEI support modules and was unable to locate at least one of them.

System response:      Processing is terminated.

User action:      Review the XPAF installation or maintenance jobs to verify that no errors occurred for XEILoad or any other XEI-prefixed load modules. If you find no errors, call Xerox Technical Support.

**XEI3302W**      **LOG DATASET NOT EMPTY, UNABLE TO SWITCH TO DSNAME=*dataset name***

Explanation:      An unsuccessful attempt was made to switch to the named dataset when it was not empty. This warning message will be produced if one of these conditions occurs:

- The currently active log is full, and automatic switching from an SD37 abend is attempted to a dataset that is not empty.
- You issue the SWITCH XLOG command to manually switch to a dataset that is not empty.

System response:      Processing continues, but the log datasets are not switched.

User action:      Clear the desired dataset either by using the ISPF editor to delete all of the contents, by running a batch job using IEBGENER to print and clear the log dataset, or by deleting and redefining the log dataset.

**XEI3303W      PRIMARY AND ALTERNATE LOG DATASETS FULL. LOGGING HAS BEEN DISABLED TO BOTH LOGS**

Explanation: An unsuccessful attempt was made to switch datasets when both the primary and alternate logs were full. This warning message will be produced if one of these conditions occur:

- The currently active log is full, and automatic switching from an SD37 abend is attempted when both the primary and alternate log datasets are full.
- You issue the SWITCH XLOG command to manually switch the log datasets when both the primary and alternate log datasets are full.

System response: Processing continues, but logging to both the primary and the alternate log datasets is disabled.

User action: Clear the log datasets to restart logging either by using the ISPF editor to delete all of the contents, by running a batch job using IEBGENER to print and clear the log dataset, or by deleting and redefining the log datasets.

- For XOAF, exit XOAF, clear the logs, and reenter XOAF.
- For XOSF, after the logs are cleared, issue the SET XOSF LOG ON command to restart logging.

**XEI3304E      LOGGING DISABLED. UNABLE TO ALLOCATE LOG DSNAME=*dataset name***

Explanation: An unsuccessful attempt was made to dynamically allocate the named log dataset.

System response: Processing continues, but logging is disabled.

User action: Verify that the log dataset name is correct and cataloged. Also, verify that no exclusive enqueues are held against the log dataset by another task, such as IEBGENER, ISPF EDIT, or TSO. Then, retry the last request that caused this message to be issued.

- For XOAF, exit XOAF, then reenter XOAF.
- For XOSF, you may have to issue the SET XOSF LOG ON command to restart logging to the dataset.

**XEI3305E      UNABLE TO OPEN LOG. RC=X'*return code*', DSNAME=*dataset name***

Explanation: An unsuccessful attempt was made to open the named log dataset.

System response: Processing continues, but logging is disabled.

User action: Look up the specified return code for the z/OS OPEN macro in the appropriate IBM manual to determine the cause of the failure. When the problem is corrected, retry the request. If you need further assistance, call Xerox Technical Support.

- For XOAF, exit XOAF, then reenter XOAF.
- For XOSF, you may have to issue the SET XOSF LOG ON command to restart logging to the dataset.

**XEI3306E      LOGGING DISABLED. I/O ERROR OCCURRED ON LOG DSNAME=dataset name**

- Explanation: The named log dataset has been corrupted and cannot be used in its current state. An I/O error was encountered when the BSAM CHECK macro was issued. The I/O error may have occurred when a batch job using IEBGENER was run to clear the named log dataset while XPAF had it open for OUTPUT EXTEND. This happened because XPAF allocates the log dataset with a DISP=SHR which allows browse or read access to the log data while XOAF or XOSF is active.
- System response: Processing continues, but logging is disabled.
- User action: Recover the log dataset using one of these methods:
- If you are using the ISPF editor, edit the named log dataset and add one character to the first line. Save the dataset, then reedit it and delete the first record. Save the dataset again.
  - If you are redefining the log dataset, run a batch job using IEBGENER to delete and define the named log dataset or use ISPF option 3.2 to delete and define the named log dataset.
- For XOAF, exit XOAF, then reenter XOAF.
- For XOSF, issue the SET XOSF LOG ON command to start logging again.

**XEI3307E      reqtype ssssssss BYTES SP ppp location 16M FAILED. RC=X'xxxxxxxx'**

- Explanation: A GETMAIN request was issued for ssssssss bytes from subpool ppp and storage was not available to satisfy the request. Reqtype will be GETMAIN or OBTAIN and location will be either ABOVE or BELOW. The RC (xxxxxxxx) indicates the return code from the OBTAIN or GETMAIN request.
- System response: Message XEI3308I will follow this message, identifying the calling program. The return code will be passed back to the calling program and that program may issue additional messages and will determine further actions to be taken.
- User action: Insure the REGION size in the XOSF start-up PROC is set to at least 6M. You may need to set it to 0M to insure the maximum amount of storage is available to the address space. Restart XOSF to eliminate any possible storage fragmentation that may exist. If the problem persists, call Xerox Technical Support.

**XEI3308I      CALLING MODULE (load module name). EP=entry point value, OFFSET=offset value**

- Explanation: This message identifies the module that issued the request and follows one of these messages:
- XEI3307E for a GETMAIN request error
  - XEI3309W, XEI3311E, or XEI3315W for a FREEMAIN error
  - XEI3317W for a storage chaining error
- If message XEI3010F is not displayed on the z/OS console, the storage request was for storage below the 16M line.
- System response: See the subsequent message from the calling module to determine the system response. For message XEI3317W, processing continues.
- User action: See the user action for the subsequent message and also the user action for XEI3307E, XEI3309W, XEI3311E, XEI3315W, or XEI3317W.

**XEI3309W      UNABLE TO FREE STORAGE AT *nnnnnnnn***

Explanation: A FREEMAIN request failed.

System response: The storage is not freed. Message XEI3308I identifies the module that initiated the FREEMAIN request.

User action: See the user action for the subsequent message from the calling module. If the condition persists, stop XOSF and then restart it. If the condition persists after restarting XOSF, call Xerox Technical Support.

**XEI3310P      PARTIAL PUTMNE ISSUED *address*. PUTMNE IGNORED**

Explanation: A FREEMAIN request was issued for an amount of storage that was less than the amount GETMAINED.

System response: The storage is not freed.

User action: If the problem persists, call Xerox Technical Support.

**XEI3311E      STORAGE VIOLATION DETECTED *address***

Explanation: A FREEMAIN request resulted in a storage violation.

System response: XPAF attempts to recover and issues message XEI3312I. Message XEI3308I identifies the module that initiated the FREEMAIN request.

User action: If the problem persists, call Xerox Technical Support.

**XEI3312I      STORAGE VIOLATION RECOVERY IN PROGRESS**

Explanation: A storage violation occurred during the processing of a FREEMAIN request. See messages XEI3308I and XEI3311E for more information.

System response: XPAF attempts to recover.

User action: See the user action for message XEI3313I or XEI3314W.

**XEI3313I      STORAGE VIOLATION RECOVERY SUCCESSFUL**

Explanation: XPAF was able to recover after encountering a storage violation. This error occurred while processing a FREEMAIN request.

System response: Processing continues.

User action: None required.

**XEI3314W      STORAGE VIOLATION RECOVERY FAILED**

Explanation: While processing a FREEMAIN request, XOSF was unable to recover from a storage violation it encountered.

System response: The storage is not freed. Message XEI3308I identifies the module that issued the FREEMAIN request.

User action: See the user action for the subsequent message from the calling module. If the problem persists, call Xerox Technical Support.

**XEI3315W POSSIBLE STORAGE VIOLATION** *address*

- Explanation: While processing a FREEMAIN request, XPAF encountered a corrupted storage chain.
- System response: The corrupted storage block is removed from the storage chain. Message XEI3308I identifies the module that issued the FREEMAIN request.
- User action: If the problem persists, call Xerox Technical Support.

**XEI3316W INVALID XSTCB ADDRESS RECEIVED BY XEIEEXIT**

- Explanation: An abend occurred, and you specified recovery with the ESTAE=Y initialization parameter. XPAF was unable to continue due to an invalid XSTCB.
- System response: Retry processing is not attempted. The abend is processed by z/OS RTM.
- User action: Call Xerox Technical Support.

**XEI3317W FSSB CHAIN ERROR DETECTED**

- Explanation: While processing a GETMAIN request, an invalid FSSB entry was encountered in the FSSB chain.
- System response: A diagnostic SNAP dump with dump title ID=055 is taken. The FSSB chain is rewritten terminating at the last valid FSSB. GETMAIN processing continues. A virtual storage block of unknown size has been lost. Other printer tasks will continue processing.
- User action: Schedule a restart of the address space as soon as possible. If the failing task is a printer task and it terminates, issue a JES start command to continue processing. Print the SNAP dump. Forward all SNAP dumps with ID=055 to Xerox Technical Support. Refer to your SNAPCLAS initialization parameter for the SNAP dump SYSOUT class.

**XEI3318W FSSB ERROR SNAP DUMP FAILED. RC=***return code*

- Explanation: This is an internal error in XEIFSNAPE. The return code is from the FSSB diagnostic SNAP dump module XEISNAPE, and its value may range from 1 to 255.
- System response: The SNAP dump is bypassed or may be incomplete. Processing continues as documented in message XEI3317W.
- User action: Forward the message text and any partial dump with SNAP dump ID=055 to Xerox Technical Support. See the action documented in message XEI3317W.

**XEI3319E** *abend code* **ABEND IN** *xei module*

- Explanation: An abend occurred during XEI processing.
- System response: Processing for the XEI function ends; other tasks continue processing.
- User action: Call Xerox Technical Support.

**XEI3327F      ERROR IN LOADING XEIRTM AS THE RESOURCE MANAGER. RC=X'*return code*'**

Explanation:    The XEIRTM module was not found in the system when the z/OS LOAD macro was issued.

System response:    XOSF processing is terminated.

User action:    Be sure the XEIRTM module is available in the normal z/OS load module search order. If it is, call Xerox Technical Support.

**XEI3328F      UNABLE TO *activity* STORAGE FOR THE XCSA. RC=X'*return code*'**

Explanation:    XOSF was unable to acquire or release storage for the XCSA control block.

System response:    If storage was being acquired, XOSF is terminated. If storage was being released, XOSF continues processing.

User action:    Call Xerox Technical Support.

**XEI3329F      UNABLE TO *activity* THE RESOURCE MANAGER. RC=X'*return code*'**

Explanation:    XOSF was unable to create or delete the XPAF resource manager.

System response:    This process initiates recovery for abnormal address space termination to clean up common resources.

                         If the resource manager was being created, XOSF processing is terminated. If the resource manager was being deleted, XOSF processing continues; approximately 48 bytes of common storage remains allocated by z/OS for the undeleted resource manager.

User action:    Call Xerox Technical Support.

**XEI3335I      FSA DISCONNECTING FOR DEVICE (*printer name*)**

Explanation:    The FSA disconnects for this printer.

System response:    The FSA is terminated.

User action:    None required.

**XEI3336I      FSA STILL ACTIVE FOR DEVICE *device name***

Explanation:    The FSA encountered an error disconnecting from JES while processing a TERMINATE TASK command for a printer task.

System response:    The subtask is terminated. The JES status of the printer is unpredictable.

User action:    Try to restart XOSF. If the problem persists, call Xerox Technical Support.

**XEI3337I      FSA DEVICE *device name* CANCELED**

Explanation:    A TERMINATE TASK command was issued for an active FSA task.

System response:    A JES3 \*CANCEL command is issued to notify JES3 that the task is being terminated abnormally.

User action:    None required.

**XEI3350F**      *module name* **FAILED TO DEFINE A RECOVERY ROUTINE. RC=X'return code'**

Explanation:      The named module unsuccessfully attempted to create an ESTAE environment to handle potential errors that might occur within the module. A message with the appropriate return code was issued.

System response:      Processing is terminated.

User action:      Call Xerox Technical Support.

**XEI3351W**      **UNABLE TO CLEAR USER FIELDS IN SSCT (*name*) AT ADDRESS (*address*)**

Explanation:      The XOSF resource manager was unable to clear the SCCTSUSE and SSCTSUS2 fields at the named address for the named SSCT.

System response:      The resource manager does not clear any fields, and XOSF continues processing.

                            This error may cause XOAF to terminate abnormally during PDS refresh processing.

User action:      Call Xerox Technical Support.

**XEI3352E**      **UNABLE TO RELEASE STORAGE FOR (*control block*) ADDRESS (*address*). RC=X'return code'**

Explanation:      The resource manager was unable to release storage for the named control block at the specified address.

System response:      The resource manager attempts to continue processing.

User action:      If an z/OS system abend accompanies the message, collect the information from the z/OS symptom dump and call Xerox Technical support.

                            If no z/OS system abend accompanies the message, determine the failure using the return code. Refer to the IBM publication that lists the return codes associated with the FREEMAIN macro.

**XEI3353E**      **ENTRY ALLOCATED BUT NOT VALID (*control block*) ADDRESS (*address*)**

Explanation:      The resource manager was unable to release storage for the named control block. The entry in the XCSA was allocated, but the address or length was not valid.

System response:      The resource manager does not attempt to free the storage. Processing continues.

User action:      Call Xerox Technical Support.

**XEI3354F**      **XEIRTM WAS UNABLE TO ESTABLISH INPUT PARAMETERS. RC=04**

Explanation:      The pointers to required control blocks were not correct; the resource manager could not establish the input parameters from z/OS.

System response:      The resource manager exits without attempting storage clean up.

User action:      Call Xerox Technical Support.

**XEI3355I      *module name* IS ATTEMPTING RECOVERY FROM THE ABEND**

Explanation:    The resource manager experienced an abend and is attempting to recover from it.

System response:    The resource manager continues processing if possible.

System response:    None required.

**XEI3356F      *module name* IS PERCOLATING ABEND. UNABLE TO FULLY RECOVER FROM THE ABEND. *abend code***

Explanation:    The named module was unable to recover from the abend stated in the message. The abend will be percolated to produce a dump.

System response:    Processing is terminated.

User action:      Call Xerox Technical Support.

**XEI3360E      LOGGING IS SET ON, BUT NO XLOG DATASET WAS SPECIFIED IN XINPARM FOR XLOGDSN. LOGGING DISABLED**

Explanation:    You specified XLOG=Y in the initialization parameters, but did not specify a value for the XLOGDSN initialization parameter. When XLOG=Y is specified, there must be a corresponding XLOGDSN entry with a log dataset name specified.

System response:    Processing continues, but logging is disabled.

User action:      Specify a log dataset name for the XLOGDSN initialization parameter and retry the request.

**XEI3361E      LOG DATA BUFFER ADDRESS ZERO, ENTRY NOT LOGGED IN DSNAME=*dataset name***

Explanation:    A request was made to write an entry to the active log dataset, but the message address was zero and therefore invalid.

System response:    Processing continues, but the entry will not be logged in the log dataset.

User action:      Call Xerox Technical Support.

**XEI3362E      COULD NOT GET XLOG BUFFER STORAGE. LOGGING HAS BEEN DISABLED. RC=X'*return code*'**

Explanation:    A request was made to get internal storage for the XLOG buffer, but the GETMAIN request failed.

System response:    Processing continues, but logging is disabled.

User action:      Call Xerox Technical Support.

**XEI3363W**      **LOG DATASET IS FULL. SWITCHED FROM DSNAME=***dataset name* **TO DSNAME=***dataset name*

Explanation:      The currently active log dataset was switched to the alternate log dataset. This warning message will be produced if one of these actions is taken:

- The currently active log is automatically switched because of an SD37 abend.
- You issue the SWITCH XLOG command to manually switch the log datasets.

System response:      Processing continues.

User action:      Print and clear the log dataset that is full. XPAF will not overwrite existing data in a log dataset.

**XEI3364E**      **BECAUSE OF ERROR, XEIMAIN IS PERMANENTLY DISABLED. REQUEST CAUSING ERROR.** *request type*

Explanation:      The services provided by XEIMAIN are no longer available to any task. The current request is displayed in the message.

System response:      Processing continues, but without any of the services offered by XEIMAIN.

User action:      Call Xerox Technical Support.

**XEI3365E**      **LOGGING ERROR, UNABLE TO LOG ENTRY TO LOG DSNAME=***dataset name*

Explanation:      An unsuccessful attempt was made to log an entry to the log dataset. XEIMAIN was posted to log the entry, but returned a failed return code to XEIXLOG, indicating that the entry was not logged.

System response:      Processing continues, but the entry is not logged in the log dataset.

User action:      Call Xerox Technical Support.

**XEI3398I**      **SDUMP** *activity*; **RC='xxxxxxx'X REASON CODE='xxxxxxx'X**

Explanation:      XOSF requested a system dump. The indicated activity for the SDUMP is either a successful capture or a failed capture.

System response:      Processing continues.

User action:      For a return code of zero, no action is required. For a non-zero return code, refer to the *z/OS Authorized Assembler Services Reference: SDUMPX Return and Reason Codes* for information on OS/390 V1R3 or higher.

**XEI3399I SDUMP SUPPRESSED; REASON CODE='xxxxxxx'X**

Explanation: XOSF requested a system dump.

System response: Processing continues.

User action: You will receive one of the following valid reason codes (in hex):

- These reason codes indicate internal use only; if the problem persists, call Xerox Technical Support:  
x'02' through x'06' or x'10' through x'24'
- These reason codes indicate percolation only; no action is required:  
x'08' or x'26'

**XEI3456E z/OS VERSION/LEVEL *version/level* NOT SUPPORTED**

Explanation: You tried to start XOSF in an unsupported environment.

System response: Initialization is terminated.

Ensure that you are using an z/OS level that is supported. For the minimum z/OS/JES levels currently supported by XPAF, refer to [Section Two: Installing and Customizing XPAF](#).

**XEI3552E UNABLE TO *action requested* BECAUSE XEIMAIN IS DAMAGED**

Explanation: Either an internal component requested service from XEIMAIN or you issued a command, but XEIMAIN was not able to respond to this request because of a previous ABEND from which it could not fully recover.

System response: Processing continues, but the request is not processed.

User action: Look for messages that were issued prior to this message to determine the cause of the failure. Bring down XPAF and restart it as soon as possible to clear the error. If further assistance is required, call Xerox Technical Support.

**XEI7202E COULD NOT GET SUFFICIENT MEMORY FOR USER SMF BUFFER**

Explanation: On returning from user exit 09 with a user supplied SMF record, XPAF was not able to acquire the storage necessary to process the record.

System response: The user supplied record is skipped.

User action: Increase the storage available to the XPAF start-up proc. Bring down XPAF and restart the proc.

## XFC messages

---

### **XFC0303E FIRST RECORD OF *resource* IS NOT A VALID HEADER RECORD**

- Explanation: The format of the data's first record does not conform to the Xerox header record format.
- System response: Font conversion is terminated.
- User action: Verify that the input data is a font. If the problem persists, call Xerox Technical Support.

### **XFC0304E SECOND RECORD OF *font name* IS NOT A VALID DESCRIPTION RECORD**

- Explanation: The format of the second record of the indicated font in the dataset does not conform to the required Xerox description record format.
- System response: Font conversion for the indicated font is terminated.
- User action: Verify that the input dataset contains a valid font.

### **XFC0305E COULD NOT *command* TABLE *table name* WHILE CONVERTING *font name*. THM RC=X'*return code*'**

- Explanation: During centralized-to-decentralized font conversion, the XPAFXFI table for the named font did not contain the necessary entries in the 'Centralized Character Mapping Name' and/or 'Decentralized Character Mapping Name' fields.
- System response: Font conversion is terminated.
- User action: Edit the XPAFXFI table for the named font, and ensure that there are valid values for the 'Centralized Character Mapping Name' and 'Decentralized Character Mapping Name' fields. Retry the conversion. For more information about font conversion, refer to [Section Three: Managing Resources with XPAF](#).

### **XFC0306E *font font name* FAILED TO CONVERT. SEE LOG FOR MORE INFORMATION**

- Explanation: The identified font could not be converted from centralized format to decentralized format.
- System response: Font conversion is terminated. XOAF processing continues.
- User action: Review the system log for additional messages that identify the cause of the problem, and take the appropriate action.  
  
Also, verify that the named centralized font is not FORMSX or FORMS\$. FORMSX and FORMS\$ have an equivalent decentralized font and are not subject to centralized-to-decentralized font conversion.  
  
If the problem persists, call Xerox Technical Support.

**XFC0308I**     *number fonts* **PROCESSED. *number* WITH ERRORS**

Explanation:     The identified number of fonts have been converted. Some may have converted with errors.

System response:     Font conversion is terminated. XOAF processing continues.

User action:     If no errors are indicated, no action is required. If errors occurred, review the XOAF log for more information.

**XFC0309E**     **FONT SIZE EXCEEDED AT CODE POINT X'*position*' WHILE DOING FONT *font name***

Explanation:     The named font exceeded the maximum font size of 64K.

System response:     Font conversion is terminated, but processing continues.

User action:     Call Xerox Technical Support.

**XFC030AE**     *entry* **NAME MISSING FROM FONT INFORMATION TABLE FOR FONT *font name***

Explanation:     While trying to convert the named font from centralized format to decentralized format, the XPAFXFI table entry for the font was found to be missing the centralized or decentralized character mapping table name.

System response:     Centralized-to-decentralized conversion for this font is terminated. If other fonts are being converted, processing of those fonts continues.

User action:     Add the appropriate name to the XPAFXFI table entry for the font, then retry the conversion.

**XFC0310I**     **FONT *font name* CONVERTED WITH *number* CHARACTERS**

Explanation:     The identified font has been converted with the specified number of characters.

System response:     Processing continues.

User action:     None required.

**XFC0315E**     **PROBLEM WITH CENTRALIZED OR DECENTRALIZED CHARACTER MAPPING TABLES. SEE LOG FOR DETAILS**

Explanation:     During centralized-to-decentralized font conversion, XOAF could not locate the necessary entries in the 'Centralized Character Mapping Name' and/or 'Decentralized Character Mapping Name' fields in the XPAFXFI table.

System response:     Font conversion is terminated.

User action:     Edit the XPAFXFI table for the appropriate font, and ensure that there are valid values for the 'Centralized Character Mapping Name' and 'Decentralized Character Mapping Name' fields. Retry the conversion. For more information about font conversion, refer to [Section Three: Managing Resources with XPAF](#).

**XFC0316W THE RESOURCE *font name* HAS A CHARACTER CODE OF X'*value*' WHICH EXCEEDS X'00FF'. THIS VALUE HAS BEEN TRUNCATED TO X'*value*'**

- Explanation: The centralized to decentralized font conversion process encountered a problem with the indicated font. The specified character code was greater than X'FF', which is the highest possible character code within any given font.
- System response: The message is issued to the XOAF screen and to the XOSF log. The hexadecimal character code value is automatically truncated. The high order byte is set to X'00'. The font conversion for that font then continues once the truncation is complete.
- User action: There is no specific action required by the user. However, the user can recreate the centralized version of the font and set the high order byte of the specified character code point to X'00'.

**XFC0317W CODE POINT X'*value*' EXCEEDS MAXIMUMS. HEIGHT=*xx*, WIDTH=*yy***

- Explanation: The identified code point exceeds the maximum allowed height and/or width.
- System response: The system substitutes a blank space for the character cell and processing continues.
- User action: Call Xerox Technical Support.

**XFC0318E *font* IS A PROPRIETARY FONT AND CANNOT BE CONVERTED**

- Explanation: An attempt was made to convert a licensed centralized font to a decentralized format.
- System response: The font is not converted to a decentralized format.
- User action: To use a licensed font on a decentralized printer, you need a licensed decentralized version of the font. Call Xerox Font Services or a third-party vendor to obtain licensed fonts.

**XFC0319E IMPROPER *attribute* FOR DSNAME *dataset name*. REQUIRED *attribute* IS: *value***

- Explanation: The named dataset does not have the proper RECFM, DSORG, and/or LRECL.
- System response: Font processing is terminated.
- User action: Correct the dataset attribute as indicated in the message, and perform centralized-to-decentralized font conversion again.

**XFC0324W CANNOT USE CURRENT XOAF LOG AS MESSAGE DATASET**

Explanation: The message dataset you specified is the current XOAF log.

System response: Additional messages are suppressed; font conversion continues.

User action: Specify an alternative dataset. The dataset must be a sequential dataset with these file specifications:

```

RECFM=FBA
LRECL=133
BLKSIZE=3325

```

**XFC0329W CHARID *charid* DROPPED FOR FONT *font name*. THAT CODE POINT IN THE SPECIFIED PLANE NUMBER IS ALREADY IN USE**

Explanation: During centralized-to-decentralized font conversion, two character IDs were mapped to the same code point and plane number combination in a decentralized character mapping table.

System response: Font conversion continues.

User action: Modify the appropriate decentralized character mapping table so that the named character ID is assigned to a unique code point and plane number combination, and retry the conversion. For more information about font conversion, refer to [Section Three: Managing Resources with XPAF](#).

**XFC0330E FONT *font name* USES OLD CHARACTER DISPATCHER. CONTACT FONT SUPPLIER**

Explanation: During centralized-to-decentralized font conversion, the named font does not contain a valid character dispatcher value.

System response: Font processing is terminated.

User action: Call either Xerox Font Services or a third-party vendor to obtain a new font with the new character dispatcher value.

**XFC0332W PLANE NUMBER FOR CHARID *character id* WAS MOVED FROM PLANE *plane number* TO PLANE 1**

Explanation: During centralized-to-decentralized font conversion, the character ID was assigned to an invalid plane number for converted decentralized fonts. The valid range is 01–08.

System response: All characters that were assigned to invalid plane numbers are automatically stored in plane 01. Font processing continues.

User action: Check the appropriate decentralized character mapping table to ensure that all the characters that are assigned to plane 01 are acceptable to you. For more information about adjusting plane numbers, refer to [Section Three: Managing Resources with XPAF](#).

|                  |                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XFC0333E</b>  | <b>FONT SIZE EXCEEDED IN PLANE</b> <i>plane number</i> <b>AT CODE POINT X'</b> <i>position</i> <b>' WHILE CONVERTING FONT</b> <i>font name</i>                                                                                                                                                                                                                      |
| Explanation:     | During centralized-to-decentralized font conversion, the named font exceeded the maximum font size of 64K. The named plane number is full.                                                                                                                                                                                                                          |
| System response: | Font conversion is terminated.                                                                                                                                                                                                                                                                                                                                      |
| User action:     | The named code point, and probably all remaining code points in the decentralized character mapping table, must be assigned the next available plane number. Then, retry the conversion. For more information about font conversion, refer to <a href="#">Section Three: Managing Resources with XPAF</a> .                                                         |
| <b>XFC0334E</b>  | <b>REQUESTED CHARID</b> <i>character id</i> <b>NOT FOUND IN DCMV TABLE WHILE CONVERTING FONT</b> <i>font name</i>                                                                                                                                                                                                                                                   |
| Explanation:     | During centralized-to-decentralized font conversion, the named character ID was not found in the decentralized character mapping table of the named font.                                                                                                                                                                                                           |
| System response: | Font conversion continues.                                                                                                                                                                                                                                                                                                                                          |
| User action:     | Add the missing entries to the appropriate decentralized character mapping table, and rerun the conversion. For more information about font conversion, refer to <a href="#">Section Three: Managing Resources with XPAF</a> .                                                                                                                                      |
| <b>XFC0336E</b>  | <b>ESCAPEMENT VALUE OF</b> <i>value</i> <b>FOR CODE POINT X'</b> <i>value</i> <b>' IN FONT</b> <i>font name</i> <b>EXCEEDS 255. SUBSTITUTING VALUE OF 255</b>                                                                                                                                                                                                       |
| Explanation:     | During centralized-to-decentralized font conversion, the specified escapement value (character spacing) for the named code point exceeded the maximum value of 255.                                                                                                                                                                                                 |
| System response: | Font conversion continues. The escapement value for the named code point is stored as 255 in the converted decentralized font. When this font is used for printing on a decentralized printer, the characters may appear crowded because the escapement value is less than originally defined in the centralized font.                                              |
| User action:     | Verify that the escapement value of 255 is acceptable for the named code point. If this escapement value causes unacceptable results, you should modify your application to use a font that does not exceed the maximum escapement value of 255. For more information about font conversion, refer to <a href="#">Section Three: Managing Resources with XPAF</a> . |
| <b>XFC0338W</b>  | <b>FST REFERENCES INCOMPLETE RASTER FOR CENTRALIZED CODE POINT X'</b> <i>code point id</i> <b>' WHILE CONVERTING</b> <i>resource name</i> .                                                                                                                                                                                                                         |
| Explanation:     | The FST entry for the identified centralized code point references raster data that is not fully within the centralized font file raster data area.                                                                                                                                                                                                                 |
| System response: | Font processing continues with the missing raster data assumed to be zeros.                                                                                                                                                                                                                                                                                         |
| User action:     | Verify that the centralized font being converted is not corrupt.                                                                                                                                                                                                                                                                                                    |

**XFC033FF      FONT name IS A SHADING FONT AND HAS NOT BEEN CONVERTED'**

Explanation: During the centralized to decentralized font conversion process, XFC has encountered a font that is a shading font. The unique nature of the shading font, typically FORMS\$ and FORMSX, requires XPAF to handle these fonts as a special case and there is no need to convert these fonts to decentralized format.

System response: The font conversion fails.

User action: If the font named in the message is either FORMS\$ or FORMSX, XPAF will handle these fonts correctly during printing. No action is required. Shading fonts with names other than FORMS\$ or FORMSX are not supported by XPAF and the applications that reference these fonts should be changed to use either FORMSX or FORMS\$.

**XFC0500E      COULD NOT *activity* DSNAME *dataset name*. EI RC=X'return code'**

Explanation: The indicated *activity* for the named dataset could not be performed.

System response: Font conversion is terminated.

User action: If the problem persists, call Xerox Technical Support.

**XFC0501E      COULD NOT *activity* FOR MEMBER *member name* OF DSNAME *dataset name*. EI RC=X'return code'**

Explanation: The indicated *activity* for the named dataset member could not be performed.

System response: Font conversion is terminated.

User action: If the problem persists, call Xerox Technical Support.

**XFC1112E      YOU MUST ENTER A MEMBER NAME FOR A PDS OR VSAM DATASET**

Explanation: While using the XOAF option to convert a centralized font to a decentralized font, you left the 'Member Name' field blank.

System response: The cursor is positioned on the 'Member Name' field. No further processing is permitted until the error is corrected.

User action: Enter a valid member name, or enter an asterisk ( \* ) to convert all fonts in the dataset.

**XFC1706I      UNABLE TO LOCATE MEMBER (*member name*)**

Explanation: When using the XOAF option to convert a centralized font to a decentralized font, an invalid member name was specified in the 'Member Name' field.

System response: The font cannot be converted. The cursor is positioned on the 'Member Name' field.

User action: Verify that the member name is located in the specified library, and that the member name is spelled correctly. Once any errors have been corrected, retry the option.

**XFC3010F      COULD NOT GET X'amount' BYTES OF MEMORY FOR** *activity*

Explanation:    This is an internal error.  
 System response:    Processing continues.  
 User action:    Specify a larger region size.

**XFC3011E      COULD NOT RELEASE X'amount of storage' BYTES OF MEMORY FROM LOCATION**  
**X'getmained area address' activity**

Explanation:    This is an internal error.  
 System response:    Processing continues.  
 User action:    None required. If the problem persists, call Xerox Technical Support.

**XFC3015E      COULD NOT** *command* **LIBRARY** *native library library ddname. LDM RC=X'return code'*

Explanation:    XPAF could not perform the named *command* on the specified library.  
 System response:    XFC processing is terminated.  
 User action:    Ensure the library exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XFC3016E      COULD NOT** *command* **MEMBER** *member name* **OF LIBRARY** *native library library ddname. LDM RC=X'return code'*

Explanation:    XPAF could not perform the named *command* on the specified member.  
 System response:    Processing is terminated.  
 User action:    Ensure the member exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XFC3017E      COULD NOT** *command* **LCA** *activity. LDM RC=X'return code'*

Explanation:    This is an internal error.  
 System response:    Processing is terminated.  
 User action:    Call Xerox Technical Support.

**XFC3018E      COULD NOT ACQUIRE TCB** *activity. THM RC=X'return code'*

Explanation:    This is an internal error.  
 System response:    Command processing is terminated.  
 User action:    Call Xerox Technical Support.

**XFC3921E**     *module name* **MODULE CANNOT BE LOADED. CALL SYSTEM ADMINISTRATOR**

Explanation:     The named required module could not be located in the XPAF load library.  
System response:     Processing is terminated.  
User action:     Call Xerox Technical Support.

**XFC6402E**     **COULD NOT** *command* **ITEM** *item name* **IN TABLE** *table name* *operation*. **THM RC=X'***return code'*

Explanation:     The indicated item is not in the named table. This message is issued for diagnostic purposes. *Operation* identifies the type of processing that was being performed when the error occurred.  
System response:     Font loading is terminated.  
User action:     Call Xerox Technical Support.

## XFS messages

---

### **XFS0100I      EXTENDED JCL *action***

Explanation:    XPAF extended JCL has been installed, reinstalled, or removed successfully.

System response:    Processing continues.

User action:    None required.

### **XFS0101E      UNABLE TO OPEN INPUT DDNAME XJDTLPA, LOAD FAILED. OPEN RC=X'*return code*'**

Explanation:    While attempting to load a module into the MLPA, XOSF was unable to open the DD name XJDTLPA. The return code was passed back from the open.

System response:    The request to load the module is terminated.

User action:    Refer to the IBM publication that lists the return codes associated with the OPEN macro. Verify that the extended JCL proc stored in your system PROCLIB contains a DD statement with the name XJDTLPA and that it is pointing to a dataset that contains the Xerox module(s). If not, add or correct the DD statement. Otherwise, call Xerox Technical Support.

### **XFS0102E      MODULE *module name* WAS NOT FOUND IN THE XJDTLPA DDNAME CONCATENATION. MODULE NOT LOADED**

Explanation:    While attempting to load the named module into the MLPA, XOSF was unable to find the module in the XJDTLPA DD name concatenation.

System response:    The named module is not loaded. Processing continues.

User action:    Verify that the module is actually in a dataset that is in the DDNAME=XJDTLPA concatenation. If the module is stored in the appropriate dataset, call Xerox Technical Support. Otherwise, place the module in the XJDTLPA DD name concatenation.

### **XFS0103E      SJF DEFINEJDVT ERROR. RC=X'*return code*'; REASON CODE=X'*reason code*', error *description***

Explanation:    While attempting to build a new JDVT, the request to install, redo, or remove the extended JCL failed.

System response:    The request is terminated. Extended JCL is not installed, reinstalled, or removed.

User action:    Call Xerox Technical Support.

**XFS0104E UNABLE TO FIND JDVT NAME (*jdvt name*) IN THE SYSTEM**

Explanation: While searching the JDVT chain, XOSF was unable to find the specified JDVT name.

System response: The request is terminated. Extended JCL is not installed, reinstalled, or removed.

User action: Call Xerox Technical Support.

**XFS0105E UNABLE TO OBTAIN LOCAL WORKAREA STORAGE FOR REQUESTOR *module name***

Explanation: XOSF attempted to acquire local workarea storage for the named support module, but was unable to obtain the storage.

System response: The request is terminated. Extended JCL is not installed, reinstalled, or removed. Modules are not loaded or deleted.

User action: Increase the region size on the EXEC statement of the extended JCL proc. If the problem persists, call Xerox Technical Support.

**XFS0106E MODULE *module name* WAS FOUND IN THE MLPA, BUT THE ENTRY IS AN LPDE AND NOT A CDE. *action taken***

Explanation: While attempting to load the named module into the MLPA or delete the named module from the MLPA, XOSF found that the entry representing the module is not a CDE as expected, but an LPDE.

System response: The request to load or delete the module is ignored.

User action: Call Xerox Technical Support.

**XFS0107E MODULE *module name* WAS ALREADY LOADED INTO THE MLPA ON *date* AT *time*. LOAD FAILED**

Explanation: While attempting to load the named module into the MLPA, XOSF found that the module had already been loaded into the MLPA at the specified date and time.

System response: The request to load the module is ignored. Processing continues.

User action: None required.

**XFS0108E CALLER IS NOT APF AUTHORIZED OR XFSJCL WAS NOT LINKED WITH AC(1)**

Explanation: The extended JCL proc was started, but the XFSJCL load module was not linked with AC(1) or the STEPLIB was not APF-authorized.

System response: The request is terminated.

User action: Have your systems programmer verify that the load library is APF-authorized and that XFSJCL was linked with AC(1), then retry the request.

**XFS0109E     INVALID JDVT EYECATCHER FOUND AT A(address)**

Explanation:     The control block could not be used because the JDVT pointer at the specified address did not have a valid eyecatcher value.

System response:     The request is terminated. Extended JCL is not installed, reinstalled, or removed.

User action:     Call Xerox Technical Support.

**XFS0110E     SJF IS NOT AVAILABLE ON THIS SYSTEM**

Explanation:     The z/OS SJF support module anchor (located off the JESCT) did not contain a valid module address.

System response:     The request is terminated. Extended JCL is not installed, reinstalled, or removed.

User action:     Call Xerox Technical Support.

**XFS0111W     EXTENDED JCL HAS ALREADY BEEN INSTALLED**

Explanation:     When you started the extended JCL proc, XOSF found that the extended JCL was already installed.

System response:     The request is terminated. Extended JCL is not installed.

User action:     If the extended JCL is to be reinstalled, specify the REDO option on the extended JCL proc. If the extended JCL is to be removed, specify the REMOVE option on the proc.

**XFS0112E     INVALID PARAMETER(S) PASSED TO MODULE *module name***

Explanation:     The input parameters passed to the specified module were found to be invalid.

System response:     The request is terminated. Extended JCL is not installed, reinstalled, or removed. Modules are not loaded or deleted.

User action:     If the module name is XFSJCL, you specified invalid parameters on the PARM statement. Correct any invalid parameters or subparameters.

                    If the module name is not XFSJCL, call Xerox Technical Support.

**XFS0113E     EXTENDED JCL NOT *action***

Explanation:     You specified the REMOVE, REDO, or INSTALL option on the extended JCL proc, but there was an error preceding this message.

System response:     The request is terminated. Extended JCL is not installed, reinstalled, or removed.

User action:     If you specified the REMOVE option on the extended JCL proc, no action is required. If you specified another option, review the preceding message to determine the cause of the extended JCL failure.

**XFS0114E      MODULE *module name* IS IN THE MLPA, BUT THE EXTENT LIST OR MODULE INFO ADDRESS IS ZERO**

Explanation: While attempting to load the named module to the MLPA or delete the named module from the MLPA, XOSF found the extent list or module information pointer to be zero.

System response: The request to load or delete the named module is ignored.

User action: Call Xerox Technical Support.

**XFS0114I      EXTENDED JCL MODULE *module name* IS IN INSTALLED**

Explanation: This message indicates the modules found in the JDT when running the DISPLAY option with the extended JCL proc.

System response: Processing continues.

User action: None required.

**XFS0115E      UNABLE TO OBTAIN SP=(*subpool number,type of storage*) STORAGE TO LOAD MODULE=*module name*, LENGTH=X'*length of storage*'. RC=X'*return code*'**

Explanation: While attempting to load the named module into the MLPA, XOSF found that the required storage from the named subpool was not available.

System response: The request to load the module is ignored.

User action: Call Xerox Technical Support.

**XFS0116E      UNABLE TO LOAD MODULES FROM A NON-APF AUTH LIBRARY/CONCATENATION, DDNAME=XJDTLPA**

Explanation: While attempting to load the module(s) into the MLPA, XOSF found that the DD name XJDTLPA contained one or more library datasets that were not APF-authorized. For security reasons, all datasets in the DDNAME=XJDTLPA concatenation must be APF-authorized.

System response: The request to load the module is ignored.

User action: Contact your systems programmer for assistance with APF authorizing the dataset.

**XFS0117I      MODULE *module name* WAS *action* THE MLPA**

Explanation: You specified the LOAD or DELETE option on the extended JCL proc in order to load the named module to the MLPA or delete the named module from the MLPA. This message indicates the success of that request.

System response: Processing continues.

User action: None required.

**XFS0118E**     *software level* **IS AN UNSUPPORTED z/OS LEVEL**

Explanation:     The extended JCL proc was started, but the system running the proc is at a level of z/OS that is not yet supported.

System response:     The request is terminated.

User action:     Call Xerox Technical Support.

**XFS0119E**     **MODULE** *module name* **WAS FOUND IN** *library name* **LIBRARY (concatenation number)**

Explanation:     While attempting to perform a redo or install request, XOSF first found the named module in the specified dataset outside of the LPA. The concatenation number is relative to zero.

System response:     The request is terminated. Extended JCL is not installed or reinstalled.

User action:     The named module must be found first in the LPA. If the module is in the STEPLIB or LINKLIB, have the named module removed, then retry the request.

**XFS0120E**     **MODULE** *module name* **WAS NOT FOUND IN THE SYSTEM**

Explanation:     While attempting to perform a redo or install request, XOSF was unable to verify the location of the named module.

System response:     The request is terminated. Extended JCL is not installed or reinstalled.

User action:     The named module must be found first in the LPA. Have your systems programmer install the named module into the LPA using one of these methods:

- Specify the LOAD option on the extended JCL proc
- Perform an IPL with CLPA

**XFS0121E**     **MODULE** *module name* **WAS NOT FOUND ON THE ACTIVE MLPA QUEUE. MODULE NOT DELETED**

Explanation:     While attempting to perform a delete request, XOSF found the named module in the system, but not on the active MLPA queue. The module cannot be deleted.

System response:     The request is terminated. The module is not deleted from the MLPA.

User action:     To load the named module into the MLPA, specify the LOAD option on the extended JCL proc.

**XFS0123E**     **MODULE** *module name* **IS CURRENTLY IN USE IN THE JDVT AND CANNOT BE DELETED. REMOVE THE MODULE FIRST**

Explanation:     While attempting to perform a delete request, XOSF found the named module in the system, but not on the active MLPA queue. The module cannot be deleted.

System response:     The request is terminated. The module is not deleted from the MLPA.

User action:     Remove the old JDT module by specifying the REMOVE option on the extended JCL proc., then re-try the DELELE option.

**XFS0122E      MODULE=*module name*, WAS LOADED INTO THE MLPA BY z/OS OR ANOTHER PRODUCT AND WILL NOT BE *action***

- Explanation: While attempting to perform a delete or load request, XOSF found the named module on the active MLPA queue; however, the module had been loaded by z/OS at IPL or had been dynamically loaded by another product.
- System response: The request is terminated. The module is not deleted from or loaded to the MLPA.
- User action: Delete the module from the MLPA using the same product with which it was loaded. Then, try the request again.

## *XFU messages*

---

**XFU0000E      000C ERROR READING FRM HEADER**

- Explanation: The transform routine received a non-zero return code from an Environmental Envelope conversion input routine.
- System response: Centralized-to-decentralized form conversion is terminated.
- User action: This message is accompanied by an error message from the Environmental Envelope input routine. Refer to the user action for that message.

**XFU0001E      000C FRM CONTAINS MORE THAN 16 FONTS**

- Explanation: The maximum number of fonts allowed in a centralized form is 32. The maximum number allowed in a decentralized form is 16 (9 of which can be concurrently active). The decentralized version of the form was unable to use all the fonts named in the centralized form.
- System response: Centralized-to-decentralized form conversion is terminated.
- User action: Redesign the centralized form using less than 16 fonts, then resubmit the job.

**XFU0002W      VERSION 1 FORM ENCOUNTERED, MARGINS SET TO MAXIMUM VALUES**

- Explanation: XPAF attempted to print a version 1 form that was converted from centralized format to decentralized format. The form did not contain edge-marking values to define the margins. During conversion, XPAF set

the margins to the maximum supported paper size. During printing, XPAF used the paper size that was specified in either the initialization parameters, printer profile, or extended JCL.

System response: Processing continues.

User action: None required.

**XFU0003E 000C FRM CONTAINS NO DATA EXCEPT HEADER**

Explanation: While processing the centralized form header, the number of blocks in the form data was found to be zero.

System response: Centralized-to-decentralized form conversion is terminated.

User action: Check for form compilation errors. Correct any errors, then recompile the centralized form.

**XFU0004E 000C NON-ZERO RETURN CODE FROM FONT CROSS-REFERENCE ROUTINE**

Explanation: While building the internal font table, the Environmental Envelope's font look-up routine sent a non-zero return code, indicating that the system encountered a condition other than NOT FOUND.

System response: Centralized-to-decentralized form conversion is terminated.

User action: This message is accompanied by a message from the Environmental Envelope. Refer to the user action for that message.

**XFU0005E 000C FRM CONTAINS UNSUPPORTED EXTENDED TEXT LINE INFORMATION**

Explanation: The form header indicates that extended text line format was used. This conversion does not support extended line format.

System response: Centralized-to-decentralized form conversion is terminated.

User action: This message is accompanied by a message from the Environmental Envelope. Refer to the user action for that message.

**XFU0006E 000C ERROR READING TL/DL BUFFER**

Explanation: The Environmental Envelope's form input routine sent a non-zero return code, indicating the system encountered a condition other than LAST BLOCK.

System response: Centralized-to-decentralized form conversion is terminated.

User action: This message is accompanied by a message from the Environmental Envelope. Refer to the user action for that message.

**XFU0007E 0008 PREVIOUS ERROR. TRANSFORM TERMINATED**

Explanation: A previous error was detected on return to the main transformation processor.

System response: Centralized-to-decentralized form conversion is terminated.

User action: Refer to the user action for the previously displayed error message.

**XFU0008E 0008 FRM DATA BLOCK COUNTS DISAGREE. EXPECTED=*count*, FOUND=*count***

- Explanation: The number of blocks displayed in the form header differs from the number of blocks processed.
- System response: Processing continues.
- User action: This message is issued at the end of the conversion. Refer to the log for possible errors.

**XFU0009E 000C UDK DISPOSITION ROUTINE ERROR**

- Explanation: The Environmental Envelope's XES disposition routine sent a non-zero return code.
- System response: Centralized-to-decentralized form conversion is terminated.
- User action: This message is accompanied by a message from the Environmental Envelope. Refer to the user action for that message.

**XFU0010I 0004 FONT *font name* NOT FOUND IN FONT INFORMATION TABLE (XPAFXFI)**

- Explanation: The indicated font was not found in the XPAFXFI table.
- System response: Processing continues.
- User action: The font name found in the form is used. If the font does not exist on the target printer, an imaging error occurs. Make sure the correct font cross-reference table is named.

**XFU0011E 000C PREMATURE EOF READING FRM HEADER**

- Explanation: The selected member did not contain a valid header record. Input may not be a valid form, or the record size of the input dataset may be incorrect.
- System response: Centralized-to-decentralized form conversion is terminated.
- User action: Verify that the input form is valid. If the problem persists, call Xerox Technical Support.

**XFU0012E 000C DOUBLE BYTE FONTS NOT SUPPORTED**

- Explanation: While processing the form header, double-byte fonts (Kanji characters) were found in the form.
- System response: Centralized-to-decentralized form conversion is terminated. This form cannot be converted.
- User action: None required.

**XFU0013E      000C UNABLE TO ACQUIRE MEMORY**

Explanation: During the conversion of a centralized form to decentralized format, XPAF was unable to acquire storage required for LOGO processing.

System response: The forms conversion is terminated.

User action: If this happens while printing a document, verify the region requirements for the XOSF startup proc. If converting a form with XOAF, check the region specified on the TSO session of batch job. If you believe you are receiving this message in error, contact Xerox Technical Support.

**XFU0014E      000C UNABLE TO RELEASE MEMORY**

Explanation: During the conversion of a centralized form to decentralized format, XPAF was unable to release storage acquired for LOGO processing.

System response: The forms conversion is terminated.

User action: This message generally indicates a problem within XPAF. Gather all resources and data necessary to recreate the failing situation and contact Xerox Technical Support.

**XFU0015W      0004 COLOR OUTPUT HAS BEEN DISCARDED**

Explanation: The color centralized form being converted to a decentralized form contains color ink resources, which are not supported on decentralized printers.

System response: Processing continues, but output consists of .FNT and .IMG data only. Any data using INK resources is not printed.

User action: None required.

## XIN messages

---

### **XIN0001E      ERRORS DURING ENVIRONMENT INITIALIZATION**

Explanation: One or more severe errors occurred while processing initialization parameters and/or loading XPAF-executable modules. This message is accompanied by one or more additional messages that may help identify the source of the problem.

System response: Initialization processing is terminated.

User action: Call your systems programmer or Xerox Technical Support.

### **XIN0002E      INVALID z/OS START FOR FSS**

Explanation: The XOSF FSS was started incorrectly with an z/OS START command entered from a system console.

System response: XOSF ends without establishing communication with the job entry subsystem (JES).

User action: Use the appropriate JES command to start the device.

### **XIN0003E      TABLE HANDLING MANAGER FAILED TO INITIALIZE**

Explanation: The initialization component received a non-zero return code from the THM initialization component (THMINIT), indicating that system utilities did not initialize properly. This message is accompanied by one or more additional messages that may help identify the source of the problem.

System response: Initialization processing is terminated.

User action: Call your systems programmer or Xerox Technical Support.

### **XIN0004E      LIBRARY DATA MANAGER FAILED TO INITIALIZE**

Explanation: The XPAF initialization component received a non-zero return code from the LDM initialization component (LDMINIT), indicating that System Utilities did not initialize properly. This message is accompanied by one or more additional messages that may help identify the source of the problem.

System response: Initialization processing is terminated.

User action: Call your systems programmer or Xerox Technical Support.

### **XIN0005E      UNABLE TO LOAD TABLE *table name***

Explanation: The initialization component was unable to locate the required module load table identified in the message.

System response: Initialization processing is terminated.

User action: Call your systems programmer to verify the availability of the required tables.

**XIN0006E      MODULE NOT FOUND ==> *module name***

Explanation:    A module load table specified that the named module must be loaded and/or executed. However, the initialization component could not locate this module.

System response:    Initialization processing is terminated.

User action:        Call your systems programmer to verify the availability of the named module in an accessible load library.

**XIN0007E      WARNING LEVEL ERROR IN *module name***

Explanation:    The initialization component received a return code from the named module that indicates a warning level error was encountered. This message is accompanied by one or more additional messages that may help identify the source of the problem.

System response:    Initialization processing continues.

User action:        Report the message to your systems programmer.

**XIN0008E      MINOR ERROR IN *module name* PROCEED? (YY/NN)**

Explanation:    The initialization component received a return code from the named module that indicates a minor level error was encountered. This message is accompanied by one or more additional messages that may help identify the source of the problem.

System response:    Processing remains stopped until the operator enters a valid response.

User action:        Investigate the problem. If necessary, call your systems programmer to determine whether to continue initialization. Enter **YY** to continue initialization. Enter **NN** to stop initialization.

**XIN0009E      UNABLE TO OPEN PFILE ==> *file name***

Explanation:    You used the PFILE initialization parameter to name a supplementary parameter file. However, the XPAF initialization component could not open the named parameter file.

System response:    The user-specified supplementary parameter list is ignored and initialization continues using:

- Default parameters specified in the default parameter list
- Installation-specific parameter list
- EXEC statement's PARM parameter

User action:        This problem may have been caused by not specifying the PFILE DD name in the XPAF job stream. Report the problem to your systems programmer.

**XIN0010E      ERROR LOADING PARM TABLE *table name***

Explanation:    The initialization component could not locate the named default table or the installation-specific parameter table.

System response:    Initialization processing is terminated.

User action:    Call your systems programmer to verify that the named table is in XINPARM.

**XIN0011I      INVALID PARAMETER IGNORED ==> *parameter***

Explanation:    The initialization component encountered a parameter that it could not find in the valid initialization parameter list. The invalid parameter is named in the message.

System response:    The invalid parameter is ignored, and XPAF initialization continues.

User action:    Call your systems programmer to verify the validity of the named parameter.

**XIN0012E      XINKEYS MODULE NOT AVAILABLE**

Explanation:    The initialization component could not find the valid initialization parameter list.

System response:    Initialization processing is terminated.

User action:    Call your systems programmer to verify that the XINKEYS module is in an accessible load library.

**XIN0013E      XOASUP01 MODULE NOT AVAILABLE**

Explanation:    The initialization component could not find the XOASUP01 module.

System response:    Initialization processing is terminated.

User action:    Call your systems programmer to verify that the XOASUP01 module is in an accessible load library.

**XIN0014E      NO PARAMETERS PROCESSED**

Explanation:    The initialization component found all specified parameter tables and processed them but did not find any valid initialization parameters in the tables.

System response:    Initialization processing is terminated.

User action:    Call your systems programmer.

**XIN0015I      XPAF V version R release INITIALIZATION COMPLETE**

Explanation:      The initialization component has successfully initialized the XOSF region of XPAF. This message includes the version and release number of the version of XOSF that was started.

System response:      Normal document processing operations can begin.

User action:      None required.

**XIN0016E      return code RETURN CODE FROM module name**

Explanation:      The initialization component received a non-zero return code from an initialization subcomponent. This message is accompanied by other messages that may help identify the source of the problem.

System response:      Initialization processing is terminated.

User action:      Investigate the problem. If the answer is not obvious from other messages, call Xerox Technical Support.

**XIN0017E      MESSAGE SERVICE FACILITY FAILED TO INITIALIZE**

Explanation:      The initialization component could not initialize the MSF component. This message may be accompanied by other messages that may help identify the source of the problem.

System response:      Initialization processing is terminated.

User action:      Call Xerox Technical Support.

**XIN0018E      XINMAIN WAS ENTERED NON-APF AUTHORIZED: CHECK AUTHORIZATION OF LOAD LIBRARY**

Explanation:      An XPAF authorization check failed.

System response:      Initialization processing is terminated.

XOSF must run from an APF-authorized load library. To verify that you have properly defined the XPAF load library, refer to the section on preparing the operating system in [Section Two: Installing and Customizing XPAF](#).

User action:      . Also verify that any local load libraries that have been added to the STEPLIB for XOSF are APF-authorized. Make any necessary changes and IPL the system to put these changes into effect. If the problem persists, call Xerox Technical Support.

**XIN0019E      XINMAIN WAS ENTERED OTHER THAN KEY(1): CHECK SCHEDXX OF SYS1.PARMLIB**

Explanation:      The XPAF FSS cannot communicate properly with JES.

System response:      Initialization processing is terminated.

User action:      Verify that the PPT entry of XINMAIN in the SCHEDxx member of SYS1.PARMLIB exists and that the XINMAIN module is found in the library specified in the IEAAPFxx member of SYS1.PARMLIB. IPL the system as required to put into effect any SYS1.PARMLIB changes you have made. If the problem persists, call Xerox Technical Support.

**XIN0020W      INVALID DATA LENGTH *parameter***

- Explanation:      The length of the value assigned to the initialization parameter shown in the message text exceeds the maximum allowable length.
- System response:      The initialization process continues and uses the default value for the specified parameter.
- User action:      Correct the data length of the specified parameter.

**XIN0021E      UNEVEN QUOTES IN XINPARM DATA**

- Explanation:      The initialization component encountered a parameter from the initialization parameter dataset that contained uneven quotes around the data.
- System response:      Initialization processing continues. The parameter is stored as coded.
- User action:      Check the parameter to verify it contains left and right quotes. Make any required changes. Bring down and restart the XPAF address space.

**XIN0022I      AN INVALID ROUTING CODE WAS SPECIFIED: *invalid routing code (reason)***

- Explanation:      An invalid routing code was specified because either:
- No value was entered.
  - A non-numeric value was entered.
  - The value entered was in the reserved range (a number between 29 and 40).
  - The second value in the range was less than the first.
  - The value exceeded the maximum value of 128.
- System response:      Processing continues. If one or more of the specified routing codes is valid, the invalid routing code is ignored and the valid values are used. If none of the values are valid, the default routing codes 2 and 11 are used.
- User action:      Specify a valid routing code (1 through 128, excluding 29 through 40) as defined in the appropriate IBM authorized assembler reference manual.

**XIN0023I      SAF STATUS REQUEST RETURNED R15=X'*return code*'**

- Explanation:      During XPAF system initialization, a RACSTAT macro returned a non-zero return code.
- System response:      XOSF processing continues.
- User action:      If USERLIB security authorization checking is required, ensure that a security package is installed and active at a supported release level. For IBM's RACF, XPAF requires a minimum release level of 1.6. Refer to the IBM publication *External Security Interface Macro Reference for z/OS and VM* for an explanation of the RACSTAT return codes.

**XIN0024W**     *initialization parameter* **IS NOT SUPPORTED AT system RELEASE** *release level*

- Explanation:     During XPAF system initialization, an initialization parameter value was detected that is not supported at the system's current release level.
- System response:     The invalid parameter value is reset to the value specified in message XIN0025I. Initialization processing continues.
- User action:     Ensure that the initialization parameter value specified is valid at the system's current release level.

**XIN0025I**     *initialization parameter* **INITIALIZATION PARAMETER RESET TO** *value*

- Explanation:     During XPAF system initialization, an initialization parameter value was detected that is not supported at the system's current release level.
- System response:     The invalid parameter value is reset to a valid default value. Initialization processing continues.
- User action:     Ensure that the initialization parameter value specified is valid at the system's current release level.

**XIN0026I**     **INVALID YES/NO PARAMETER IGNORED** **====>** *parameter*

- Explanation:     The initialization component encountered a parameter that requires a Y or N value, but the value specified was not Y or N. The invalid parameter is shown in the message.
- System response:     The invalid parameter is ignored. Initialization processing continues.
- User action:     Correct the specified parameter value to use a valid value of Y or N.

**XIN0027I**     **INVALID NUMERICS OR VALUE TOO HIGH** **====>** *parameter*

- Explanation:     The initialization component encountered a parameter that requires a numeric value, but the value specified was either not numeric or it exceeded the limit allowed. The invalid parameter is shown in the message.
- System response:     The invalid parameter is ignored. Initialization processing continues.
- User action:     Correct the specified parameter to use a valid numeric value.

**XIN0028I**     **VALUE** *error type* **OF nnn** **====>** *parameter*

- Explanation:     The initialization component encountered a parameter that requires a numeric value, but the value specified either exceeded the maximum limit or was below the minimum limit. The maximum or minimum value and the invalid parameter are shown in the message.
- System response:     The invalid parameter is ignored. Initialization processing continues.
- User action:     Correct the specified parameter to use a valid numeric value.

**XIN0029I      INVALID INITIALIZATION SUBPARAMETER SPECIFIED FOR *parameter***

OR

**INVALID INITIALIZATION SUBPARAMETER *value* SPECIFIED FOR *parameter***

Explanation:      Either the subparameter name you specified is invalid, or the subparameter value you specified is invalid.

System response:      All user-specified subparameter entries for this parameter are ignored. XPAF uses the default values for the subparameters.

User action:      Specify a valid subparameter name and value for the identified parameter.

**XIN0030F      XPAF EXTENDED JCL IS NOT INSTALLED**

Explanation:      During the initialization of the FSS, XOSF has detected that the XPAF extended JCL keywords have not been installed.

System response:      Initialization terminates and the FSS shuts down.

User action:      Run the XPAFJCL job to install the XPAF extended JCL keywords and then restart the printer(s) controlled by this FSS.

**XIN0030W      XPAF EXTENDED JCL IS NOT INSTALLED**

Explanation:      During the initialization of the FSS, XOSF has detected that the XPAF extended JCL keywords have not been installed.

System response:      Initialization continues.

User action:      If you intend to use the XPAF extended JCL keywords, shut down XOSF, install the keywords and restart the printer(s) controlled by this FSS.

**XIN0031F      XPAF EXTENDED JCL IS NOT AT THE CORRECT LEVEL FOR THIS VERSION OF Z/OS/  
CORRECT AND RETRY**

Explanation:      XOSF has detected that it is running on a z/OS 2.1 system and that an old version of the XPAF extended JCL JDTs has been installed. XOSF is unable to resolve this inconsistency and, to avoid documents printing incorrectly, terminates

System response:      XOSF terminates.

User action:      IRemove the old XESJDT00 module and install the correct XZSJDT21 JDT module, by running the XPAFJCL Started Task with the P=REMOVE option, followed by the P=INSTALL option. Make sure that the XPAF JCL Started Task procedure has been updated to specify the XPAF libraries.

**XIN3585W      nn DAYS LEFT IN GRACE PERIOD**

Explanation:      The expiration date has passed for the product. A grace period has been entered and there are nn days left in the grace period before the product will cease to function.

System response:      The product will continue to function normally.

User action:      Contact Xerox for a new License String to extend the license period.

**XIN3586E      nn-DAY GRACE PERIOD HAS EXPIRED!**

Explanation:      The expiration date has passed for the product. The extended grace period has also expired.

System response:      The product will cease to function.

User action:      Contact Xerox for a new License String to extend the license period.

**XIN3589W      \*\*\* WARNING \*\*\* WARNING \*\*\* WARNING \*\*\* WARNING \*\*\***

Explanation:      This message is issued in conjunction with message XIN3591I (\*\*  
WARNING \*\*\* XPAF LICENSE WILL EXPIRE IN nn DAYS.)

System response:      Processing continues.

User action:      Contact Xerox in order to renew the license string.

**XIN3590E      XINSLSTR HAS INVALID *KEYWORD* OF *VALUE* MESSAGE**

Explanation:      While processing the License String member, XINSLSTR, an invalid *value* for the specified *keyword* was discovered. The *message* string at the end of the message describes the allowable values.

System response:      System initialization will be terminated.

User action:      Correct the keyword in the XINSLSTR member.

**XIN3593E      NO VALID LICENSE STRING FOUND FOR *PRODUCT***

Explanation:      While processing the License String member, XINSLSTR, no license string was found for the *product*.

System response:      Processing is terminated and the XOSF address space will be shut down.

User action:      Contact Xerox in order to order the correct license string.

**XIN3594E      *PRODUCT* LICENSE HAS EXPIRED ON *DATE***

Explanation:      While processing the License String member, XINSLSTR, it was determined that the expiration date of the *product* has expired.

System response:      Processing is terminated and the XOSF address space will be shut down.

User action:      Contact Xerox in order to renew the license string.

**XIN3595I      *PRODUCT* LICENSE WILL EXPIRE IN *NUMBER* DAYS ON *DATE***

Explanation:      This informational message is displayed at XOSF startup.

System response:      Processing continues.

User action:      None required.

## XIS messages

---

**XIS1425E**     *input* **MEMBER** *member name* **OF DSNAME** *dataset name* **IS EMPTY**

Explanation:     The named member in the named dataset does not contain any data.  
 System response:     Command processing is terminated.  
 User action:     Specify a member that contains the image to be processed.

**XIS1701I**     *requested count resource* **PROCESSED.** *converted count resource* **CONVERTED. SEE LOG FOR DETAILS**

Explanation:     This message lists the number of images processed and the number of images successfully converted.  
 System response:     Processing continues.  
 User action:     Check the XOAF log or system log for information about any unconverted images.

**XIS1702E**     *image name* **IS NOT IN .IMG OR RES FORMAT**

Explanation:     The named image was not in .IMG format.  
 System response:     Image conversion is terminated. Processing continues.  
 User action:     Make sure the dataset conforms to the .IMG format.

**XIS1703I**     *image name* **RASTER TOTALS. RAW (value), LIN (value), ENC (value), HTN (value)**

Explanation:     The named image was compressed using the four techniques listed, and the message summarizes these totals. XPAF displays this message for each image processed.  
 System response:     Processing continues.  
 User action:     None required.

**XIS1704I**     **MEMBER NAME** (*image name*) **EXCEEDS 6 CHARACTER LENGTH, ENTRY BYPASSED**

Explanation:     The specified image name was longer than six characters.  
 System response:     This entry is skipped. Processing continues for the next member.  
 User action:     Rename the image with a 1- to 6-character member name.

**XIS1705I**     (*image name*) **DOES NOT BEGIN WITH ICC, SKIPPING TO LCC**

Explanation:     The specified image did not have an ICC at the start of the compressed data. Characters were skipped until a valid LCC was found.  
 System response:     Processing continues using the available data. This may produce a corrupted image.  
 User action:     Check the image for possible corruption.

**XIS1706I      UNABLE TO LOCATE MEMBER** (*member name*)

Explanation: When using the XOAF option to convert a centralized image to a decentralized image, an invalid member name was specified in the MEMBER NAME field.

System response: The image cannot be converted. The cursor is positioned on the MEMBER NAME field.

User action: Verify that the member name is located in the specified library, and that the member name is spelled correctly. If wildcards are being used, at least one member in the specified library must match the given member name. Once any errors have been corrected, retry the option.

**XIS1707I      CANNOT LOCATE VALID LCC IN** (*image name*), **CONVERSION ABORTED**

Explanation: XPAF encountered the end of the file while trying to read data. The file size specified in the header is not correct.

System response: Processing continues using the available data.

User action: Check the file for truncation and/or the source of the image.

**XIS3010F      COULD NOT GET X'bytes of memory' BYTES OF MEMORY** *activity*

Explanation: The specified amount of space was not available. This space is required whenever an image is to be rotated.

System response: Conversion is terminated, but processing continues.

User action: Increase the space parameter to run in a larger partition.

**XIS3011E      COULD NOT RELEASE X'bytes of memory' BYTES OF MEMORY FROM LOCATION**  
**X'address' activity**

Explanation: The specified amount of memory could not be returned to the system. The amount and/or address has been corrupted.

System response: Conversion is terminated, but processing continues.

User action: Check the #DLS space, if available.

**XIS3015E      COULD NOT** *operation* **LIBRARY** *dataset name activity*. **LDM RC=X'***return code'*

Explanation: XPAF could not perform the named activity on the specified library.

System response: Processing from the library is terminated.

User action: Ensure the library exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XIS3016E      COULD NOT *operation* MEMBER *member name* OF LIBRARY *library name* DURING INITIALIZATION. LDM RC=X'return code'**

Explanation:      XPAF could not perform the named *operation* on the specified member.

System response:      Processing of the member is terminated. Processing of other members continues.

User action:      Ensure the member exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XIS3017E      COULD NOT *operation* LCA *activity*. LDM RC=X'return code'**

Explanation:      The initialization/termination call to the primary I/O support routines failed. The LCA pointer may have been corrupted.

System response:      Processing is terminated, but XOAF remains active.

User action:      Use the return code as a guide to further action.

**XIS6407E      NO DDNAME SPECIFIED *activity***

Explanation:      During the conversion of a centralized image to decentralized format, either the input dataset name or output dataset name was omitted.

System response:      The conversion is terminated.

User action:      Verify that the input and output dataset names were specified correctly, and rerun the conversion.

**XIS6408E      PREMATURE EOF WHILE READING IMAGE LIBRARY**

Explanation:      XPAF encountered the end of the file while trying to read data. The file size specified in the header was not satisfied.

System response:      Processing continues using the available data.

User action:      Check the file for truncation and/or the source of the image.

**XIS6410I      IMAGE *image name* DOES NOT CONFORM TO STANDARD IN *axis-DIRECTION*, *value* SUPPLIED BY HEADER**

Explanation:      The X-direction or Y-direction was not a multiple of 8.

System response:      The X-direction or Y-direction is padded with white space and processing continues.

User action:      Check the source of the image. Padding may result in undesirable effects in some applications.

**XIS6412I      RASTER COUNT (*count value*) DOES NOT AGREE WITH VALUE SUPPLIED BY HEADER  
(*supplied value*) FOR IMG image**

Explanation:      The number of rasters read was not the same as the number expected.  
This message may result if message XIS6410I was issued.

System response:      Check the source of the image for possible damage.

User action:      By itself, this message suggests that the image file may be corrupted or  
beyond the ability of the decentralized printer.

## XJC messages

---

### **XJC3010F**      **COULD NOT GET X'*amount*' BYTES OF MEMORY** *activity*

Explanation:      This is an internal error.

System response:      Document processing is terminated. The XOSF address space remains active.

User action:      Call Xerox Technical Support.

### **XJC3701E**      **UNRECOGNIZED PAL COMMAND:** *command name*

Explanation:      This is an internal error.

System response:      Document processing is terminated. The XOSF address space remains active.

User action:      Call Xerox Technical Support.

### **XJC4003E**      **FRAGMENT SIZE X'*value*' DOES NOT AGREE WITH EXPECTED SIZE X'*value*'** *activity*

Explanation:      This is an internal error.

System response:      Document processing is terminated. The XOSF address space remains active.

User action:      Call Xerox Technical Support.

### **XJC4600I**      **NEITHER FORM *form* NOR SYSOUT CLASS *class* FOUND IN *jdl* XJCF SIMULATION TABLES. FORM *form2* USED**

Explanation:      The form and class identified by *form* and *class* could not be found in the FORMS and CLASS tables within the XJCFSIM table for the JDL identified by *jdl*.

System response:      Document processing continues using *form2*, which is the first form in the FORMS table for the identified JDL.

User action:      Verify that the correct form and/or SYSOUT class was specified. If necessary, add the form or class to the XJCFSIM table, reassemble the table, link-edit it into your XPAF load library, then resubmit the job.

### **XJC4601E**      *table name* **TABLE NOT FOUND. XJCF SIMULATION NOT POSSIBLE**

Explanation:      A document was sent to a printer that was designated to run in XJCF simulation mode, but the XJCFSIM table was not found in the XPAF load library.

System response:      Document processing continues without XJCF simulation.

User action:      Assemble the XJCFSIM table, link-edit it into your XPAF load library, then resubmit the job.

**XJC4602E      SKIP VALUE *skip value* CONFLICTS WITH OFFSET VALUE *offset value* activity**

Explanation:      This is an internal error.

System response:      Document processing is terminated. The XOSF address space remains active.

User action:      Call Xerox Technical Support.

**XJC4604E      UNRECOGNIZED PRINTER TYPE SPECIFIED. *printer name* activity**

Explanation:      This is an internal error.

System response:      Document processing is terminated. The XOSF address space remains active.

User action:      Call Xerox Technical Support.

**XJC4606I      *jdl* JDL NOT FOUND IN XJCF SIMULATION TABLE. *jdl2* USED INSTEAD**

Explanation:      The JDL named in the job being processed through XJCF simulation, *jdl*, was not found in the XJCFSIM table.

System response:      Document processing continues using *jdl2*, which is the first JDL entry in the XJCFSIM table.

User action:      Verify that the correct JDL was specified. If necessary, add the JDL to the XJCFSIM table, assemble it, link-edit it into your XPAF load library, then try the job again.

## XJD messages

---

### **XJD0117W TASSIGN/TRESET RANGE INPUT SPECIFIER MISMATCH**

Explanation: A range input specifier was indicated but is incomplete; the end range is missing.

System response: The system continues processing.

User action: Complete the range or remove the range delimiter (-) and recompile the JSL file.

### **XJD0118W LOWER RANGE VALUE IS GREATER THAN UPPER RANGE VALUE -- IGNORED**

Explanation: The lower range value is greater than the upper range value.

System response: The system continues processing.

User action: Reduce the lower range or increase the upper range so that the upper range is greater than or equal to the lower range and recompile the JSL file.

### **XJD0119E BAD OR MISSING UNIT SPECIFICATION, STR = <UNIT>**

Explanation: User-defined units were referenced but were not defined or were incorrectly defined.

System response: The system continues processing.

User action: Correct or add the required user-defined units or remove the reference to the user-defined units and recompile the JSL file.

### **XJD0120I WARNING: VALUE MAY BE TOO HIGH, STR = <VALUE>**

Explanation: The value specified may be too high.

System response: The system continues processing.

User action: Make sure the value is within range as specified and recompile the JSL file.

### **XJD0121I WARNING: "STAPLE = YES" NOT ALLOWED WITH "NT01 = NO"**

Explanation: The value YES for parameter STAPLE cannot coexist with the value NO for the parameter NT01.

System response: The system continues processing.

User action: Change YES to NO for STAPLE, or NO to YES for NT01 (according to your needs) and recompile the JSL file.

**XJD0122I      WARNING: JOB WILL USE “STAPLE=YES,NTO1=YES”**

Explanation:      The system will use “STAPLE=YES,NTO1=YES” for the output JDL.  
System response:      The system continues processing.  
User action:      Make sure that “STAPLE=YES,NTO1=YES” is what you want for your JDL. Otherwise, correct your JSL according to the previous message and recompile the JSL file.

**XJD0123I      WARNING: “NTO1=NO,FACEUP=YES” SPECIFIED WITH “DUPLEX=YES”**

Explanation:      The specified combination of parameter options is inconsistent.  
System response:      The system continues processing.  
User action:      Change the parameters to be consistent for your JDL and recompile the JSL file.

## XJS messages

---

### **XJS1115E    INVALID VALUE OF '*value*' FOUND IN *statement type keyword*= STATEMENT**

Explanation:    The PDL processor found an invalid value in the named keyword.  
 System response:    Processing continues. The statement is ignored.  
 User action:    Correct the DJDE or PDL statement, and resubmit the job.

### **XJS1116W    MORE THAN 64 LINE NUMBERS SPECIFIED FOR ASSIGN. EXTRAS ARE IGNORED**

Explanation:    The PDL or DJDE ASSIGN statement contains more than 64 line numbers.  
 System response:    Processing continues. Excess line numbers are ignored.  
 User action:    Correct the DJDE or PDL statement, and resubmit the job.

### **XJS1122E    WHILE PROCESSING MEMBER '*member-name*' IN PDLLIB**

Explanation:    This message supplies additional information for message XJS1115E. It describes the PDL member name being processed when the error occurred.  
 System response:    Processing continues. The statement is ignored.  
 User action:    Correct the PDL statement and resubmit the job.

### **XJS3010F    COULD NOT GET X'*number of bytes*' BYTES OF MEMORY *activity***

Explanation:    Could not acquire memory for the named activity.  
 System response:    Processing is terminated.  
 User action:    Increase the region size, and retry the activity. If the problem persists, call Xerox Technical Support.

### **XJS6103E    PDL LIBRARY NOT DEFINED. PROCESSING INCOMPLETE**

Explanation:    The PDLLIB DD statement or dataset is not defined.  
 System response:    Processing continues using only DJDE information.  
 User action:    Define a native library using the PDLLIB initialization or printer profile parameter, and resubmit the job.

**XJS6104E**     *member name* **NOT FOUND IN** *ddname* **PDL LIBRARY. PROCESSING INCOMPLETE**

- Explanation:     The named member could not be located in the native library associated with the DD name identified in the message.
- System response:     Processing continues without the missing member.
- User action:     Perform these steps:
- Verify that you specified the correct member name in the data stream and/or JCL for the job.
  - Use the PDL loader to load the PDL into the library associated with the DD name identified in this message.

**XJS6227I**     **ERROR PROCESSING THM** *command.* **PROCESSING** *table*

- Explanation:     An error occurred while attempting to process internal tables. This message may be preceded by additional messages from THM that identify the exact cause of the problem.
- System response:     Processing is terminated.
- User action:     Correct the problem identified by any preceding THM messages. If there are no preceding THM messages call Xerox Technical Support.

**XJS7101E**     *module name* **RECEIVED AN INVALID REQUEST OF** *request*

- Explanation:     An incorrect function request was made to the named module. This is an internal error.
- System response:     Document processing is terminated.
- User action:     Call Xerox Technical Support.

## XLC messages

---

### **XLC0002I UNSEQUENTIAL LOGO FOUND:<LOGONAME>**

- Explanation: A logo was found with a character order that is not ABCDEF. I.E., it may be DEFABC.
- System response: The logo conversion is continued but the proper character ordering is accomplished so the logo will print correctly. This is an informational message only.
- User action: No action is required by the user.

### **XLC0303E FIRST RECORD OF *resource* IS NOT A VALID HEADER RECORD**

- Explanation: The format of the dataset's first record does not conform to the Xerox header record format.
- System response: Logo conversion is terminated.
- User action: Verify that the input dataset is a logo. If the problem persists, call Xerox Technical Support.

### **XLC0304E SECOND RECORD OF *resource* IS NOT A VALID DESCRIPTION RECORD**

- Explanation: The format of the second record in the dataset does not conform to the required Xerox description record format.
- System response: Logo conversion is terminated.
- User action: Verify that the input dataset contains a valid logo.

### **XLC0305E COULD NOT *activity* TABLE *table name* operation. THM RC=X'return code'**

- Explanation: An attempt to process the indicated table failed. *Table name operation* identifies the type of processing that was being performed when the error occurred.
- System response: Logo conversion is terminated.
- User action: Verify that the table library is correctly specified to XPAF and available. If you believe that you are receiving this message in error, contact Xerox Technical Support.

### **XLC0306I *logo name* FAILED TO CONVERT. SEE LOG FOR MORE INFORMATION**

- Explanation: The identified logo could not be converted from a centralized logo to a decentralized font.
- System response: Logo conversion is terminated. XOAF processing continues.
- User action: Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XLC0308I**     *number resource* **PROCESSED. number WITH ERRORS**

Explanation:     The identified number of logos has been converted.  
 System response:     Processing continues.  
 User action:     If no errors are indicated, no action is required. If errors occurred, review the XOAF log for more information.

**XLC0309E**     **FONT SIZE EXCEEDED AT CODE POINT X'position' WHILE DOING FONT** *font name*

Explanation:     The named font being built exceeded the maximum font size of 64K.  
 System response:     Logo conversion is terminated, but XOAF processing continues.  
 User action:     Call Xerox Technical Support.

**XLC0316W**     **THE RESOURCE** *logo name* **HAS A CHARACTER CODE OF X'value' WHICH EXCEEDS X'00FF'. THIS VALUE HAS BEEN TRUNCATED TO X'value'**

Explanation:     The source logo is corrupted.  
 System response:     Processing continues with the truncated value.  
 User action:     Call Xerox Technical Support.

**XLC0317W**     **CODE POINT X'value' EXCEEDS MAXIMUMS. HEIGHT=xx, WIDTH=yy**

Explanation:     The identified code point exceeds the maximum allowed height and/or width.  
 System response:     The system substitutes a blank space for the character cell and processing continues.  
 User action:     Call Xerox Technical Support.

**XLC0319E**     **IMPROPER** *attribute* **FOR DSNAME** *dataset name*. **REQUIRED ATTRIBUTE IS:** *value*

Explanation:     The specified dataset does not have the proper RECFM, DSORG, and/or LRECL.  
 System response:     Processing is terminated.  
 User action:     Correct the dataset as indicated in the message.

**XLC0321I**     **LOGO** *logo name* **CONVERTED WITH** *number* **CHARACTERS**

Explanation:     The converted logo contains the specified number of printable code points. See the message log for more details.  
 System response:     Processing continues.  
 User action:     None required.

**XLC0322W    CODE POINT X'*value*' WITH WIDTH OF *value* EXCEEDS MAXIMUM WIDTH OF 255. WIDTH FORCED TO 255**

Explanation:    The raster data for the given centralized code point exceeds the decentralized maximum.

System response:    Processing continues with the diminished value.

User action:    The logo in its current format may not be suitable for conversion.

**XLC0323W    CODE POINT X'*value*' WITH BYTE COUNT OF *value* EXCEEDS MAXIMUM VALUE OF 64. BYTE COUNT FORCED TO 64**

Explanation:    The raster data for the given centralized code point exceeds the decentralized maximum.

System response:    Processing continues with the diminished value.

User action:    The logo in its current format may not be suitable for conversion.

**XLC0324W    CANNOT USE CURRENT XOAF LOG AS MESSAGE DATASET**

Explanation:    The message dataset you specified is the current XOAF log.

System response:    Additional messages are suppressed; font conversion continues.

User action:    Specify an alternative dataset. The dataset must have these attributes:

DSORG=PS  
RECFM=FBA  
LRECL=133  
BLKSIZE=3325

**XLC0335W    INPUT CODE POINT X'*position*' TREATED AS A METACODE CODE POINT. CODE POINT BYPASSED**

Explanation:    During the conversion of a centralized logo to a decentralized font, XPAF detected a Metacode entry with the FST that had an unexpected configuration. This may indicate a problem with the centralized resource being converted.

System response:    Logo conversion continues, but the named code point is skipped. This action is taken for all Metacode values within a logo.

User action:    Check the output of the conversion to verify that all valid characters from the logo are present in the converted font. No action is necessary if all characters are present. If there is a problem with the converted font, you may have an invalid logo. Verify that your centralized logo is valid.

- XLC0338E FST REFERENCES INCOMPLETE RASTER FOR CENTRALIZED CODE POINT X'code point id' WHILE CONVERTING resource name.**
- Explanation: The FST entry for the identified centralized code point references raster data that is not fully within the centralized logo file raster data area.
- System response: Centralized-to-decentralized conversion for this logo is terminated. If other logos are being converted, processing of those logos continues.
- User action: Recreate the centralized version of the logo and ensure that the FST entry references raster data that is fully contained within the centralized logo raster data area.
- 
- XLC0500E COULD NOT activity DSNAME dataset name. EI RC=X'return code'**
- Explanation: The indicated *activity* for the named dataset could not be performed.
- System response: Logo conversion is terminated.
- User action: If the problem persists, call Xerox Technical Support.
- 
- XLC1112E YOU MUST ENTER A MEMBER NAME FOR A PDS OR VSAM DATASET**
- Explanation: While using the XOAF option to convert a centralized logo to a decentralized font, you left the 'Member Name' field blank.
- System response: The cursor is positioned on the 'Member Name' field. No further processing is permitted until the error is corrected.
- User action: Enter a valid member name, or enter an asterisk ( \* ) to convert all the logos in the dataset.
- 
- XLC1706I UNABLE TO LOCATE MEMBER (member name)**
- Explanation: When using the XOAF option to convert a centralized image to a decentralized image, an invalid member name was specified in the MEMBER NAME field.
- System response: The image cannot be converted. The cursor is positioned on the MEMBER NAME field.
- User action: Verify that the member name is located in the specified library, and that the member name is spelled correctly. If wildcards are being used, at least one member in the specified library must match the given member name. Once any errors have been corrected, retry the option.
- 
- XLC3010F COULD NOT GET X'bytes of storage' BYTES OF MEMORY activity**
- Explanation: This is an internal error.
- System response: Processing continues.
- User action: Specify a larger region size.

**XLC3011E    COULD NOT RELEASE X'*amount of storage*' BYTES OF MEMORY FROM LOCATION X'*getmaind area address*' FOR activity**

Explanation:    This is an internal error.

System response:    XPAF processing continues.

User action:    None required. If the problem persists, call Xerox Technical Support.

**XLC3015E    COULD NOT *command* LIBRARY *native library action*. LDM RC=X'*return code*'**

Explanation:    During the conversion of a centralized logo to a decentralized font, an error was encountered accessing one of the required libraries. The action text provides details about where in the conversion process the error occurred.

System response:    The conversion is terminated.

User action:    Verify that all input and output libraries are specified correctly and available to XPAF. If you believe you are receiving this message in error, contact Xerox Technical Support.

**XLC3016E    COULD NOT *activity* MEMBER *member name* OF LIBRARY *native library action*. LDM RC=X'*return code*'**

Explanation:    During the conversion of a centralized logo to a decentralized font, an error was encountered accessing one of the required libraries. The *action* text provides details about where in the conversion process the error occurred.

System response:    The conversion is terminated.

User action:    Verify that all input and output libraries are specified correctly and available to XPAF. If you believe you are receiving this message in error, contact Xerox Technical Support.

**XLC3017E    COULD NOT *command* LCA *action*. LDM RC=X'*return code*'**

Explanation:    During the conversion of a centralized logo to a decentralized font, an attempt to acquire or release an LCA was unsuccessful. The *action* text provides details about where in the conversion process the error occurred.

System response:    The conversion is terminated.

User action:    Verify that all input and output libraries are specified correctly and available to XPAF. If you believe you are receiving this message in error, contact Xerox Technical Support.

## XLD messages

---

### **XLD0700E    AN ERROR HAS OCCURRED IN PROCESSING. SEE LOG FOR MORE INFORMATION**

Explanation:    An XLD processing error occurred.  
 System response:    XLD processing is terminated.  
 User action:    Refer to the message log for other messages that may help explain the problem.

### **XLD0701I    operation **COMPLETED** action**

Explanation:    An XLD function completed as described in the message text. For example, the message "DELETE COMPLETED SUCCESSFULLY FOR member OF library BY userid" indicates that the member was deleted successfully from a native library by the user specified.  
 System response:    None.  
 User action:    None required.

### **XLD1301E    LIST *list name* **NOT ACCESSIBLE.** action**

Explanation:    A list pointer passed to an internal XPAF service routine was zero. This is an internal logic error within XPAF.  
 System response:    The current activity is terminated.  
 User action:    Gather all materials related to the error and contact Xerox Technical Support.

### **XLD1302E    DELETE LIST *list name* **REQUEST FAILED.** reason**

Explanation:    You entered a list name that either does not exist or is invalid. The delete request failed.  
 System response:    XOAF processing is terminated.  
 User action:    Verify that the list name exists and is valid and retry the option. If the option fails again, call Xerox Technical Support.

### **XLD1306E    INVALID INTERNAL FUNCTION. *module name***

Explanation:    This is an internal error.  
 System response:    XLD processing is terminated.  
 User action:    Call Xerox Technical Support.

### **XLD1307E    COULD NOT ALLOCATE AND OPEN *dataset name*. RC=X'return code'**

Explanation:    The indicated dataset name was allocated and opened, but did not successfully complete. Examine the return code to determine the cause of the error:

- 000C    The library dataset or DASD volume is full. Provide more space for the library.
- 0016    A problem external to XPAF is preventing the library from being accessed.
- 0024    The region size is too small to hold the control block. Increase the region size.

For all other return codes, call Xerox Technical Support.

System response:    XLD processing is terminated.

User action:        Depending on the displayed return code, either correct the problem and rerun the job, or call Xerox Technical Support.

**XLD4153E    MEMBER *member name* NOT FOUND IN LIBRARY *library name***

Explanation:        The named member was not found in the specified library.

System response:    Processing continues.

User action:        Ensure that the member name is correct and exists in the library. Correct any errors and try the function again.

## XLW messages

---

**XLW7101E**    *module name* **RECEIVED AN INVALID REQUEST OF** *function code*

Explanation:    This is an internal error.  
 System response: Document processing is terminated.  
 User action:    Call Xerox Technical Support.

**XLW7102I**    **I/O ERROR DURING** *operation* **OF** *printer name*

Explanation:    An unrecoverable error occurred on the named printer. This can happen during CLOSE or deallocation of the printer.  
 System response: Processing continues.  
 User action:    Determine the cause of the problem and correct it if possible.

**XLW7103I**    *cuu* **HAS BEEN RELEASED FROM XOSF**

Explanation:    The named printer was deallocated from XPAF and is available for other use.  
 System response: Processing continues.  
 User action:    None required.

**XLW7104I**    **DEVICE ALLOCATION FAILED FOR** *printer name*. **CUU=***cuu*; **RC=X'***return code*; **REASON CODE=X'***reason code*

Explanation:    Dynamic allocation failed for the named printer. The printer may already be allocated to another task (XPAF or JES). Message XLW7124E may follow this message and provide more information.  
 System response: The printer task is terminated.  
 User action:    If the problem persists, call Xerox Technical Support.

**XLW7105E**    **DEVICE OPEN FAILED FOR** *printer name*, **CUU=***cuu*

Explanation:    An error occurred while opening the named printer. OPEN processing was not completed. The operating system displays more problem-related messages.  
 System response: The printer task is terminated.  
 User action:    Call Xerox Technical Support.

**XLW7106I XNS CONNECTION FAILED FOR *printer name***

Explanation: The printer could not connect to the HIP printer software.

System response: The printer task is terminated.

User action: The printer may not be in HIP mode, or it may have been left in an unknown state when it was last used. Unload and reload the HIP processor on the printer and start the printer again. If this fails, make sure the printer is running on the correct version of its operating system software.

**XLW7107I ALLOCATING *cuu* TO *printer name***

Explanation: XPAF is allocating the named printer to the XOSF address space.

System response: The printer is allocated and opened.

User action: None required.

**XLW7108I *cuu* HAS BEEN ALLOCATED TO XOSF**

Explanation: The named printer was allocated to the XOSF address space.

System response: Processing continues.

User action: None required.

**XLW7109I OPENING *printer name* AT *cuu ddname***

Explanation: XOSF is opening the named printer.

System response: Processing continues.

User action: None required.

**XLW7110E I/O ERROR ON *printer name*. CUU=*cuu*, ECB=xxxxxxx**

Explanation: An unrecoverable I/O error occurred on the named printer. Message XLW7111I, which contains the IOB standard information, follows this message.

System response: The printer task is terminated.

User action: Determine the cause of the I/O error and correct it.

**XLW7111I IOBSTD=*value***

Explanation: This message follows message XLW7110E. It describes a printer I/O error.

System response: The printer task is terminated.

User action: Determine the cause of the I/O error and correct it.

**XLW7112I**     *printer name. CUU=cuu, status*

- Explanation:     This message displays the printer's status.
- System response:     Processing continues unless another message indicates otherwise.
- User action:     If the message indicates that printer operator intervention is necessary, the printer may be jammed or out of paper.

**XLW7124E**     **REASON CODE=***text*

- Explanation:     A device allocation failed for a channel-attached printer. XLW7104I identifies the error. This message supplies additional information about the failure if the return code is a known code.
- System response:     The printer start-up is terminated.
- User action:     Correct the problem identified by message XLW7104I, then start the printer again.

## XOA messages

---

### XOA0001I      **ERROR - PDS REFRESH NO LONGER REQUIRED OR SUPPORTED**

Explanation: This is an informational message that is issued in response to a REFRESH command being issued in a batch XOAF job. With the introduction of AUTOREV support, PDS libraries no longer require refreshing and the REFRESH command is no longer supported.

System response: Processing continues.

User action: No action required.

### XOA3473E      **GETMAIN FOR** *number* **BYTES FAILED FOR** *control block* **IN** *program name*. **RC=X'***return code'*

Explanation: The indicated program issued a GETMAIN request that could not be honored.

System response: The task is terminated.

User action: Increase the region size or decrease the number of printer tasks running in the XOSF address space and restart XOSF. If the error persists, call Xerox Technical Support.

### XOA3530E      *module* **ABENDED IN ROUTINE** *routine*. **CC X'***completion code'*

Explanation: An abend in XOAF processing was intercepted.

System response: The task is terminated.

User action: Call Xerox Technical Support with the module name, routine name, completion code, accompanying dump, and XOAF log.

### XOA3899W      **MEMBER** *member name* **OFFLOADED 0 DIRLEN TO DSNAME** *dataset name*

Explanation: While using the offload function of the XOAF Manage Libraries option to offload a member, the member was offloaded without user directory information.

System response: The message is issued to the XOAF screen and to the XOSF log. The offload function is now complete.

User action: Verify that the resource will function correctly without the user directory information. If unusable resources are produced, use the LDM batch offload/reload process as an alternative.

### XOA3900I      **MEMBER=***member name* **OFFLOADED TO DSNAME:** *dataset name*

Explanation: The specified member was offloaded to the named dataset.

System response: Processing continues.

User action: None required.

**XOA3901E SECONDARY KEYWORD IS MISSING**

Explanation: While parsing a TSO or batch command, a required secondary keyword was missing.

System response: Command processing is terminated.

User action: Correct the command syntax so it includes all required keywords. Enter the command again. Refer to the *XPAF TSO/Batch Commands Quick Reference Card* for the syntax of each command.

If the problem persists, call Xerox Technical Support.

**XOA3902E ISPLINK ADDRESS IS NOT VALID. CALL XEROX TECHNICAL SUPPORT**

Explanation: This is an internal error.

System response: XOAF remains active.

User action: Call Xerox Technical Support.

**XOA3903E DATA ENTERED IN ISPF IS NOT VALID. CORRECT AND REENTER**

Explanation: Invalid data was entered in ISPF.

System response: XOAF remains active.

User action: Correct the data and enter the command again.

**XOA3904F XOAF FUNCTION ABENDED. RC=*return code*; COMPLETION CODE=*completion code***

Explanation: This is an internal error.

System response: Depending on the severity of the abend, XOAF may remain active.

User action: Call Xerox Technical Support.

**XOA3905E MODULE *module name* NOT FOUND IN XOAF LIBRARY**

Explanation: An XOAF function was requested, but the module was not found in the XOAF library.

System response: XOAF remains active.

User action: Ensure that the XPAF load library is allocated to the TSO session either in STEPLIB or ISPLLIB, and that the specified module is in the library. If the problem persists, call Xerox Technical Support.

**XOA3906E LEFT PARENTHESIS MISSING AFTER KEYWORD. REENTER COMMAND**

Explanation: The left parenthesis after a command keyword was missing.

System response: XOAF remains active.

User action: Correct the command syntax by inserting the opening parenthesis and enter the command again. If the problem persists, call Xerox Technical Support.

**XOA3907E ERROR ENCOUNTERED WHILE PARSING *command*. CALL SYSTEM ADMINISTRATOR**

Explanation: No keyword was found in the identified command.

System response: The command is ignored and the operator is prompted for the next command.

User action: Make sure the command is properly constructed and contains all of the required parameters.

**XOA3908E *keyword* KEYWORD UNDEFINED OR WRONG LENGTH. CORRECT AND REENTER**

Explanation: Either a keyword was misspelled or an invalid keyword was entered in a TSO or batch command.

System response: XOAF remains active, but the command is terminated.

User action: Correct any errors in the command syntax and enter the command again. Refer to the *XPAF TSO/Batch Commands Quick Reference Card* to determine the syntax of each command.

**XOA3909E THE REQUESTED XOAF FUNCTION HAS NOT BEEN FOUND IN THE INTERNAL FUNCTION TABLE**

Explanation: An XOAF function was not found in the XOAF internal function table.

System response: XOAF remains active.

User action: Make sure the value entered for the function is valid for XOAF. If the value is not valid, correct it and try again. If the value is valid, call your system administrator or Xerox Technical Support.

**XOA390AE *keyword* SPECIFIED IS INVALID. CORRECT AND REENTER**

Explanation: The keyword value specified for the resource conversion is invalid.

- If the resource is a form, you must specify P (portrait) or L (landscape) for the orientation.
- If the resource is an image, you must specify 0, 90, 180, or 270 for the rotation.

System response: Command processing is terminated.

User action: Correct the keyword value and resubmit the job.

**XOA3910E *module* IS UNABLE TO OBTAIN SUFFICIENT STORAGE TO COMPLETE THE REQUEST**

Explanation: XOAF could not find enough storage to complete the requested function.

System response: XOAF remains active.

User action: Increase the region size and try again. If the problem persists, call Xerox Technical Support.

**XOA3911E ONLY ONE SECONDARY KEYWORD ALLOWED PER PRIMARY COMMAND**

Explanation: More than one secondary keyword was entered. Only one is allowed.  
System response: XOAF remains active.  
User action: Correct any errors in the command syntax and enter the command again.

**XOA3912E DSNAME OR MEMBER NAME IS NOT VALID. CORRECT AND REENTER**

Explanation: An invalid dataset name was entered for the dataset parameter in the command.  
System response: XOAF remains active.  
User action: Enter a valid dataset name. For the REFRESH command, if necessary, ask your system administrator for valid datasets and member names.

**XOA3913E ERROR RETURNED FROM USER SECURITY. CALL SYSTEM ADMINISTRATOR**

Explanation: The user security routine load failed during a call from a program.  
System response: XOAF remains active.  
User action: Contact your system administrator. Make sure the user security routine is correct and in place. If the problem persists, call Xerox Technical Support.

**XOA3914E COMMAND CONTAINS INVALID PRIMARY KEYWORD. CORRECT AND REENTER**

Explanation: An invalid XOAF command was entered. The primary keyword is either invalid or unrecognizable.  
System response: XOAF remains active.  
User action: Verify that the XOAIN record is in fixed format, then correct the command syntax and enter the command again.

**XOA3915E NO COMMA IN START COMMAND. CORRECT AND REENTER**

Explanation: A comma was missing in the command syntax for START.  
System response: XOAF remains active.  
User action: Correct the command syntax and enter the command again.

**XOA3916E THE PROFILE FOR *command* COMMAND IS NOT VALID**

Explanation: The requested profile's name was not valid.  
System response: XOAF remains active, but the command is terminated.  
User action: Refer to [Section Five: XPAF Parameter and Keyword Reference](#) for descriptions of valid profile entries. Correct the list and enter the command again.

**XOA3917E    INVALID PROFILE NAME ENCOUNTERED IN PROFILE LIST**

Explanation:    XOAF found an invalid profile name or incorrect entry while scanning the profile list.

System response:    XOAF remains active, but command processing is terminated.

User action:    Refer to [Section Five: XPAF Parameter and Keyword Reference](#) for descriptions of valid profile entries. Correct the list and enter the command again.

**XOA3918E    A PROFILE LIST OF MORE THAN 12 ENTRIES WAS ENCOUNTERED**

Explanation:    The operator entered more than the maximum of 12 entries in a profile list.

System response:    XOAF remains active, but command processing is terminated.

User action:    Enter no more than 12 entries in the profile list. If the problem persists, call Xerox Technical Support.

**XOA3919E    PARENTHESES NOT PAIRED IN DSNAME**

Explanation:    The dataset name was entered without a pair of parentheses.

System response:    XOAF remains active.

User action:    Correct the problem, then enter the list again.

**XOA3921E    *module name* MODULE CANNOT BE LOADED. CALL SYSTEM ADMINISTRATOR**

Explanation:    XOAF could not load the named program module.

System response:    XOAF remains active, but the command is terminated.

User action:    Verify that the indicated module is resident in XOAF's load library. If not, move the affected module into the load library. If it is in the load library, call Xerox Technical Support.

**XOA3922E    *keyword* SECONDARY KEYWORD INVALID. CORRECT AND REENTER**

Explanation:    An invalid secondary keyword was entered.

System response:    XOAF remains active.

User action:    Correct any errors in the syntax, then enter the command again.

**XOA3923E    *keyword* KEYWORD NOT FOUND IN COMMAND. CORRECT AND REENTER**

Explanation:    XOAF scanned the command line and did not find a required keyword.

System response:    XOAF remains active.

User action:    Correct any errors in the keywords and syntax and enter the command again.

**XOA3924F LDM ENCOUNTERED AN ERROR TRYING TO** *operation*

Explanation: The Library Data Manager (LDM) could not perform one of these tasks:

- Acquire enough storage to load the named module
- Read the dataset because it has been corrupted
- Read the dataset because it is not in a recognizable format

System response: The function is terminated, but XOAF remains active.

User action: Try the operation again after performing one of these tasks:

- Increase the region size.
- Correct the corrupted file. Corrupted files may need to be recreated, or restored from a backup source.
- Correct the spelling of the dataset name.

If the problem persists, call Xerox Technical Support.

**XOA3926E THE** *keyword* **VALUE IS INVALID**

Explanation: The value of the named keyword was outside the acceptable range.

System response: Command processing is terminated.

User action: Correct any invalid keyword values.

**XOA3927E PARENTHESES NOT PAIRED IN DOCID LIST**

Explanation: In a TSO/batch command, the opening and closing parentheses for a parameter were not used in a pair.

System response: Processing is terminated.

User action: Recode the TSO/batch command using the correct syntax and rerun the job.

**XOA3928E CODE OR DSNAME REQUIRED FOR DISPLAY. REENTER COMMAND**

Explanation: The operator pressed the ENTER key on a panel without entering the required code name or dataset name.

System response: XOAF remains active.

User action: Enter the required code name or dataset name. If the problem persists, call Xerox Technical Support.

**XOA392AE MEMBER NAME NOT ALLOWED IN OUTPUT DATASET. CORRECT AND REENTER**

Explanation: Resource conversion saw the input member name as the output member name. Either no output member name is allowed or the output member name is invalid.

System response: Resource conversion is terminated.

User action: Correct the output dataset entry and enter the command again.

**XOA392BE MEMBER NAME MISSING. CORRECT AND REENTER**

Explanation: The XOAF batch or TSO command contained a dataset name without a required member name.

System response: Document processing is terminated.

User action: Add the required member name to the command and submit the XOAF request again. Refer to the *XPAF TSO/Batch Commands Quick Reference Card* for information on member names required in commands.

**XOA392CE DECENTRALIZED RESOURCE LOAD REQUIRES INPUT MEMBER. CORRECT AND REENTER**

Explanation: The member name associated with the input dataset name was missing from the load command. Decentralized resources can only be loaded from a partitioned dataset, so you must specify a member name. The member name can be an asterisk (\*).

System response: Resource loading is terminated.

User action: Add the required member name to the command and submit the XOAF request again.

**XOA392DE MEMBER NAME MUST BE NO LONGER THAN *nn* CHARACTERS. CORRECT AND REENTER**

Explanation: The member name was longer than the specified number of characters.

System response: Command processing is terminated.

User action: Correct the length of the member name, then retry the option.

**XOA392EI *keyword* KEYWORD MISSING OR INVALID. DEFAULT VALUE OF *value* USED**

Explanation: The secondary keyword was either missing or misspelled. The default value for this keyword was used.

System response: Processing continues using the default value.

User action: Verify that the default value for the keyword is the value you want to use. If not, correct the value, then resubmit the batch job. Refer to [Section Five: XPAF Parameter and Keyword Reference](#) for default value information.

**XOA3930F DIRECTORY CONTAINS NO MEMBERS**

Explanation: You attempted to access a directory that has no members.

System response: XOAF remains active.

User action: Enter a directory that contains members. If the problem persists, call Xerox Technical Support.

**XOA3931F ENTERED LIBRARY DOES NOT EXIST OR IS ALLOCATED TO ANOTHER USER OR JOB**

Explanation: XPAF attempted to gain access to a library that either does not exist on the system or is already in use.

---

**NOTE:** This message cannot be suppressed.

---

System response: XOAF remains active.

User action: Enter the library correctly and try again.

**XOA3932F ENTERED LIBRARY NOT ACCESSIBLE. REASON CODE=reason code**

Explanation: XPAF attempted to gain access to a library, but was denied for the reason indicated by the code.

System response: XOAF remains active.

User action: Call your system administrator or Xerox Technical Support.

**XOA3933E ALLOCATE FOR BROWSE RETURNED return code**

Explanation: While attempting to browse a dataset, a request for DASD storage failed. There was not enough space available on the DASD volume.

System response: XOAF remains active.

User action: Make sure there is enough disk storage space available to perform XOAF functions. Try browsing datasets using XOAF batch jobs.

**XOA3934E DATASET OPEN FOR LIST MEMBER RETURNED return code**

Explanation: XOAF was unable to OPEN a work dataset.

System response: XOAF remains active.

User action: Verify that there is sufficient disk storage space to perform XOAF functions. Also, line numbers may be present in VB format CLIST files in XPFCLIB. These line numbers must be removed by using the UNNUM command before converting from FB to VB format.

**XOA3935E DATASET ALLOCATION FOR LIST MEMBER RETURNED return code**

Explanation: Due to insufficient disk space, the dynamic allocation of storage to BROWSE a dataset failed.

System response: XOAF remains active.

User action: Make sure there is enough disk storage space available to perform XOAF functions. Try browsing datasets using XOAF batch jobs.

- XOA3936F**     *program name* **ENCOUNTERED AN XOAF SUPERSTRUCTURE ERROR. RC=***return code*
- Explanation:     This is an internal error.
- System response:     XOAF processing is terminated.
- User action:     Call Xerox Technical Support.
- 
- XOA3937F**     **XOASUP20 UNABLE TO OPEN** *ddname* **FILE**
- Explanation:     This is an internal error.
- System response:     XOAF remains active.
- User action:     Call Xerox Technical Support.
- 
- XOA3938F**     **XOASUP20 FAILED TO WRITE A RECORD TO** *ddname*
- Explanation:     This is an internal error.
- System response:     XOAF remains active.
- User action:     Call Xerox Technical Support.
- 
- XOA3939I**     *message text*
- Explanation:     This message is created by the XOAF user security exit. Although it is logged as a service of XOAF, it is controlled by the user security exit code. The user exit can use the message to explain why an XOAF user was denied permission to perform a function. The maximum length of this message is 200 characters.
- System response:     None.
- User action:     The action depends on the message generated.
- 
- XOA393AE**     *keyword* **IS A DUPLICATE KEYWORD OR CONFLICTS WITH A PREVIOUS KEYWORD**
- Explanation:     Either a keyword was entered twice, or a conflicting set of keywords was entered for the REFRESH command.
- System response:     This command is ignored. The system prompts for a new command.
- User action:     Correct the keyword parameters and enter the command again.
- 
- XOA393BE**     **VALUE FOR 'keyword' KEYWORD IS MISSING OR INVALID**
- Explanation:     The value for the indicated keyword was either missing or invalid.
- System response:     This command is ignored. The system prompts for a new command.
- User action:     Correct the keyword parameters and enter the command again.

**XOA393CE    INVALID OR INSUFFICIENT PARAMETERS FOR THE 'keyword' COMMAND**

Explanation:    The combination of parameters was not valid.  
 System response:    This command is ignored. The system prompts for a new command.  
 User action:    Enter the correct parameters and enter the command again.

**XOA393DI    REFRESH REQUEST HAS BEEN SCHEDULED**

Explanation:    XOAF processing completed successfully for the REFRESH command.  
 System response:    Processing continues.  
 User action:    None required.

**XOA393EE    UNKNOWN RC X'*return code*' FROM *module name***

Explanation:    XPAF found an unrecognizable internal return code.  
 System response:    This command is ignored. The system prompts for a new command.  
 User action:    Record all available information about the command, including this and any other messages. Give this information to your system administrator.

**XOA393FF    MEMBER NAME MUST NOT BE SPECIFIED FOR REFRESH**

Explanation:    When using the TSO batch command to refresh a dataset, a member name was specified for the dataset.  
 System response:    The dataset is not refreshed.  
 User action:    Remove the member name from the TSO/batch command, then resubmit the job. Refer to the *XPAF TSO/Batch Commands Quick Reference Card* for information on member names required in commands.

**XOA3940E    THE PRINTER OR JOB SPECIFIED IS NOT CURRENTLY ACTIVE**

Explanation:    The REFRESH command contained a printer name or XOSF parameter that is not currently active.  
 System response:    This command is ignored. The system prompts for a new command.  
 User action:    Find out if the printer or parameter named in the REFRESH command is active. Correct the problem and enter the command again.

**XOA3941E    'TYPE' SPECIFIED WITHOUT 'PRINTER' OR 'XOSF'**

Explanation:    The attempted command was incomplete.  
 System response:    This command is ignored. The system prompts for a new command.  
 User action:    Call Xerox Technical Support.

**XOA3942E      PROTOCOL ERROR. SEE SYSTEM ADMINISTRATOR**

Explanation:      This is an internal error.  
System response:    This command is ignored. The system prompts for a new command.  
User action:        Call Xerox Technical Support.

**XOA3943E      XOSF ADDRESS SPACE DID NOT HAVE THE CORRECT REFRESH ENVIRONMENT**

Explanation:      The program was unable to schedule the REFRESH. A previously scheduled REFRESH may still be in progress, or there may be an error in XOSF.  
System response:    This command is ignored. The system prompts for a new command.  
User action:        Try the refresh again later. If no refresh is in progress, call Xerox Technical Support.

**XOA3944E      REFRESH REQUEST VIA 'DS' PARAMETER NOT YET FUNCTIONAL**

Explanation:      This function is not yet implemented.  
System response:    This command is ignored. The system prompts for a new command.  
User action:        Request the REFRESH command through TYPE and either PRINTER or XOSF.

**XOA3945E      NO PARAMETERS ENTERED FOR '*command*' COMMAND**

Explanation:      The REFRESH command was entered without parameters.  
System response:    This command is ignored. The system prompts for a new command.  
User action:        Specify the appropriate parameters, then enter the command again.

**XOA3948E      INVALID XOAF COMMAND '*command*'. CORRECT AND REENTER**

Explanation:      The entered command is invalid.  
System response:    The command is ignored. The system prompts for a new command.  
User action:        Reenter the command using the correct syntax. Refer to the *XPAF TSO/Batch Commands Quick Reference Card* for the correct TSO/batch syntax.

#### XOA3949F UNABLE TO ALLOCATE LIBRARY

Explanation: XOAF could not access a library. One of these problems occurred:

- You did not have security access to the dataset.
- The specified dataset does not exist.
- The dataset was allocated to another job.
- The dataset does not have the expected dataset organization (DSORG).

System response: The library is not displayed, but XOAF remains active.

User action: Enter the command again after performing these tasks:

- Verify that you have specified the correct dataset name, and that you have sufficient authority to access the dataset.
- If necessary, free the dataset from the other allocations.

#### XOA394AE UNABLE TO RELEASE STORAGE

Explanation: Module XOASPF01 was unable to release local storage.

System response: XOAF processing is terminated.

User action: Call Xerox Technical Support.

#### XOA3950E *type* MEMBER NAME NOT ALLOWED WHEN *function*

Explanation: When loading fonts, the output name is taken from the header, and therefore should not be specified.

System response: Command processing is terminated.

User action: Correct the command and reenter it.

#### XOA3951E INPUT FOR RESOURCE CONVERSION MUST BE A PARTITIONED DATASET

Explanation: The dataset specified as input is not a partitioned dataset (PDS). You must specify a PDS member.

System response: Processing is terminated.

User action: Check the input dataset name and ensure a PDS is specified.

#### XOA3952E UNABLE TO READ DSNAME '*dataset name*'. SEE LOG FOR DETAILS

Explanation: The named dataset has an invalid record format or has been corrupted.

System response: XOAF processing is terminated.

User action: Check the XOAF log for previous messages that may describe the problem. Make sure the named dataset does not specify RECFM=U (Undefined Record Format).

**XOA3953E A MEMBER NAME IS NOT VALID WITH THE LDM LIBRARY DIRECTORY COMMAND**

Explanation: While using the TSO/batch option to display a directory of library members, you specified a member name with the dataset name.

System response: Command processing is terminated.

User action: Remove the member name from the command and resubmit the job. Refer to the *XPAF TSO/Batch Commands Quick Reference Card* for information on member names required in commands.

**XOA3954E GRS GQSCAN FOR *queue name* FAILED WITH RC=X'return code'**

Explanation: A Global Resource Serialization (GRS) error occurred while locating XOSF resources for an XOAF refresh request.

System response: The refresh request is not performed.

User action: For return code 12, which indicates a GRS error, retry the request one or more times. For all other return codes, call Xerox Technical Support.

**XOA3955E INVALID '*parameter name*' PARAMETER SPECIFIED IN THE 'CONVERT *resource type*' COMMAND**

Explanation: The value for the named parameter, specified with the CONVERT *resource type* TSO/batch command, is invalid or missing.

System response: Processing is terminated.

User action: Correct the syntax, and resubmit the command. Refer to the *XPAF TSO/Batch Commands Quick Reference Card* for the correct TSO/batch syntax.

**XOA3990E USER NOT AUTHORIZED FOR XOAF. CALL SYSTEM ADMINISTRATOR**

Explanation: The user attempted to access an XOAF function without authorization or with improper authorization.

System response: XOAF processing continues.

User action: Call Xerox Technical Support.

**XOA3992E ISPF REQUEST FAILED TO ESTABLISH AN ESTAE ENVIRONMENT PRIOR TO INVOKING XOAFUSEC**

Explanation: Authorization was denied for this XOAF function.

System response: XOAF remains active.

User action: Call Xerox Technical Support.

**XOA3994W    INVALID *range* RANGE LIMIT. HEXADECIMAL VALUE MUST BE BETWEEN X'20' AND X'FF'. VALUE SET TO *value***

- Explanation:    The lower or upper range limit, specified with the CONVERT XFONT TSO/batch command, was not a valid value. The specified value was substituted.
- System response:    Processing continues using the substituted value.
- User action:    If the substituted value is not acceptable, correct the lower or upper range limit, and resubmit the command.

**XOA3995E    NO LONGER VALID TO PRECONVERT *resource type***

- Explanation:    The TSO/batch command used to preconvert the specified resource type (forms or images) is no longer valid. XPAF will dynamically convert forms and images during job processing.
- System response:    Preconversion processing is terminated.
- User action:    Run the job and allow XPAF to dynamically convert forms and images.  
For information on the TSO/batch commands supported by XPAF, refer to the *XPAF TSO/Batch Commands Quick Reference Card*.

**XOA3996E    WHEN USING THE WILD CARD, NO OUTPUT MEMBER NAME CAN BE SPECIFIED**

- Explanation:    An attempt was made to execute an incorrect load command. The input member that was specified was an asterisk (\*), which is a wildcard causing all members of the specified input dataset to be processed. Along with this, an output member for the output dataset was specified. No output member should be specified for the output dataset when the input member is the wildcard.
- System response:    The resource(s) are not loaded. This error message is issued to the XOAF and system logs. Processing is terminated.
- User action:    Correct the input load command and resubmit the load request via the batch execution job or the XOAF panel. If the input member name needs to be the wildcard, remove the output member name. If the output member name needs to be specified, use a specific input member name that does not utilize the wildcard.

**XOA3997E    INVALID CONVERT *resource type* COMMAND. THE SAMPLE PARAMETER MUST BE SPECIFIED**

- Explanation:    An attempt was made to execute an incorrect CONVERT *resource type* TSO/batch command. The input command did not contain the required SAMPLE parameter.
- System response:    The conversion is not performed. This error message is issued to the XOAF and system logs. Processing is terminated.
- User action:    Correct the input command and resubmit the convert request via the batch execution job. Refer to the *XPAF TSO/Batch Commands Quick Reference Card* for the correct TSO/batch syntax.

**XOA3998E    INVALID CONVERT *resource type* COMMAND. THE LISTING PARAMETER MUST BE SPECIFIED WHEN THE SAMPLE PARAMETER VALUE IS 'Y' OR 'R'**

- Explanation:    An attempt was made to execute an incorrect CONVERT *resource type* TSO/batch command. The input command specified that a SAMPLE was required but did not contain the LISTING parameter.
- System response:    The conversion is not performed. This error message is issued to the XOAF and system logs. Processing is terminated.
- User action:    Correct the input command and resubmit the convert request via the batch execution job. The LISTING parameter must be specified when a SAMPLE is requested.

**XOA3999E    INVALID CONVERT XFONT COMMAND. THE *range* RANGE LIMIT PARAMETER MUST BE SPECIFIED WHEN THE SAMPLE PARAMETER VALUE IS 'R'**

- Explanation:    An attempt was made to execute an incorrect XFONT command. The input command did not contain the indicated lower or upper range parameter.
- System response:    The conversion is not performed. This error message is issued to the XOAF and system logs. Processing terminate.
- User action:    Correct the input command and resubmit the convert request via the batch execution job. When the SAMPLE parameter has a value of R, both the LOWER and UPPER range parameters must be specified. Their valid values must be a hexadecimal number between X'20' and X'FF'.

## XOAF messages

---

There are two versions of XOAF messages: a short version that appears on line one of a panel and a long version that appears on line three. The long version appears only if you enter HELP or press PF1 when a short message is displayed. Both versions of the message are provided in this chapter.

### **XOAF003E    INVALID REQUIRED ENTRY** **ENTER THE VALID *job card information* IN THE REQUIRED FIELD.**

- Explanation:    You entered fewer than nine characters on the first job card field on the panel.
- System response:    The cursor is positioned on the command line. No further processing is permitted until the error is corrected.
- User action:    Complete the job card fields with valid information.

### **XOAF004E    WILDCARDS NOT ALLOWED** **WILDCARDS ARE NOT SUPPORTED FOR *member name* WITH THIS FUNCTION.**

- Explanation:    You entered a member name containing one or more wildcard characters (\* or ?) for an XOAF option that does not support wildcards.
- System response:    The cursor is positioned on the 'Member Name' field. No further processing is permitted until the error is corrected.
- User action:    Enter the specific member name without using any wildcard characters and retry the option.

### **XOAF005E    *table name condition*** **TABLE *table name condition* IN *dataset name*.**

- Explanation:    An attempt to create the named paper-related table failed.
- System response:    Paper table processing is terminated.
- User action:    If the table already exists, it must first be deleted before you create a new one with the same name, or you can update the existing table instead.

### **XOAF006E    XOAF ALREADY ACTIVE** **IF USING SPLIT SCREENS, ENTER "END" OR PRESS PF3 TO RETURN TO XOAF.**

- Explanation:    While using split screens, you attempted to start multiple XOAF sessions. Only one active XOAF session at a time is allowed.
- System response:    The cursor is positioned on the command line. No further processing is permitted until the error is corrected.
- User action:    Enter **END** to return to the active XOAF session.

**XOAF007W MEMBER NOT FOUND  
MEMBER NAME ENTERED ON LOCATE OR FIND COMMAND IS NOT IN LIBRARY.**

- Explanation: You entered an ISPF locate or find command for a member that does not exist in the selected library.
- System response: The cursor is positioned on the command line. No further processing is permitted until the error is corrected.
- User action: Enter a valid member name, then reissue the locate or find command. Alternatively, you can use the ISPF scroll commands.

**XOAF008E MISSING REQUIRED ENTRY  
ENTER *entry* AT THE CURSOR POSITION.**

- Explanation: You left a required field blank.
- System response: The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.
- User action: Enter a valid value in the field.

**XOAF009E DATASET NOT FOUND  
DATASET *dataset name* COULD NOT BE FOUND.**

- Explanation: While creating or updating a resident resource list, XOAF was unable to locate the dataset name you entered on the panel.
- System response: The cursor is positioned on the command line. No further processing is permitted until the error is corrected.
- User action: Ensure that you entered the name of the native library containing all the resident resource lists. In the XOSF start-up proc, this is the dataset name in the DD statement specified by the LIBRARY printer profile parameter.
- If you do not want XOAF to prefix the dataset name with your user ID, enter the fully qualified dataset name in quotes.

**XOAF020E INVALID MEMBER NAME  
THE MEMBER NAME MUST FOLLOW STANDARD z/OS NAMING CONVENTIONS.**

- Explanation: You entered an invalid name in the 'Member Name' or 'List Name' fields. The name must conform to z/OS naming conventions.
- System response: The cursor is positioned on the invalid name. No further processing is permitted until the error is corrected.
- User action: Correct the member name.

**XOAF023E INSUFFICIENT STORAGE  
THERE IS INSUFFICIENT VIRTUAL STORAGE TO COMPLETE THIS FUNCTION.**

- Explanation: XOAF could not allocate sufficient storage to perform a requested task.
- System response: No further processing is permitted.
- User action: Increase the XOAF region size and try the option again. If the problem persists, call Xerox Technical Support.

**XOAF032E      MAXIMUM VALUE EXCEEDED  
THE *dimension* HAS BEEN ADJUSTED TO THE MAXIMUM ALLOWABLE VALUE.**

- Explanation: While creating or updating a paper name table, you entered a value that exceeds the maximum value for the named *dimension*, WIDTH or HEIGHT.
- System response: The maximum value for the specified unit is substituted for the invalid value; for example, the maximum value for DOTS is 32767.
- User action: If you do not want the maximum value substituted for WIDTH or HEIGHT, enter the desired value.

**XOAF033E      MAXIMUM SIZE EXCEEDED  
THE LARGEST POINT SIZE ALLOWED IS 99.9.**

- Explanation: While updating the XPAFFFI table, you entered an invalid point size.
- System response: The cursor is positioned on the 'Point Size' field. No further processing is permitted until the error is corrected.
- User action: Correct the point size value.

**XOAF034E      *range* RANGE LIMIT ERROR  
HEXADECIMAL VALUE MUST BE BETWEEN X'20' AND X'FF'.**

- Explanation: The lower or upper range limit you specified was not a valid value.
- System response: The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.
- User action: Enter a valid value in the field within the specified range.

**XOAF050E      MISSING REQUIRED ENTRY  
ENTER FONT NAME(S) AT THE CURSOR POSITION.**

- Explanation: When installing custom replica fonts using version 6 encoding or above, you left blank or made an invalid entry in the 'Centralized Font' field.
- System response: The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.
- User action: Enter the name of the font(s) to be loaded. You can enter a specific font name in this field, or use a wildcard character to select all fonts or fonts beginning with a specified prefix.

**XOAF051E      INVALID SYNTAX  
DO NOT ENTER QUOTES FOR DATASET PREFIX.**

- Explanation: You entered quotes, which are not allowed, on the dataset prefix.
- System response: The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.
- User action: Enter the high-level and mid-level qualifiers for your system load library without quotes.

**XOAF052E      CONFLICTING ENTRIES  
YOU MUST SPECIFY INPUT FROM DISK OR FILE, BUT NOT BOTH.**

Explanation:      When installing custom replica fonts using version 6 encoding or above, both the 'INSTALL INPUT FROM DISK' and the 'INSTALL INPUT FROM file' sections were completed.

System response:      No further processing is permitted until the error is corrected.

User action:      Complete either the section for disk or file, but not both.

**XOAF053E      MISSING REQUIRED ENTRY  
YOU MUST ENTER AN INPUT DISK DATASET OR FILE INPUT ENTRY.**

Explanation:      When installing custom replica fonts from disk using version 6 encoding or above, the 'Font Dataset Name', 'XPAFI2X Table Dataset Name', and 'Character Map Dataset Name' fields were not completed.

System response:      No further processing is permitted until the error is corrected.

User action:      Enter all required dataset names and retry the option.

**XOAF054E      MISSING REQUIRED ENTRY  
ENTER FONT DATASET NAME AT THE CURSOR POSITION.**

Explanation:      You did not enter the dataset name for the input fonts.

System response:      The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.

User action:      Enter the name of the PDS or sequential dataset that contains the fonts to be loaded.

**XOAF057E      MISSING REQUIRED ENTRY  
ENTER NATIVE FONT LIBRARY NAME AT THE CURSOR POSITION.**

Explanation:      You did not enter the native font library to which the fonts will be loaded.

System response:      The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.

User action:      Enter the name of the native centralized or decentralized font library to which the fonts will be loaded.

**XOAF058E      MISSING REQUIRED ENTRY  
ENTER MESSAGE DATASET NAME AT THE CURSOR POSITION.**

Explanation:      You did not enter the dataset name to which messages will be written.

System response:      The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.

User action:      Enter the name of the sequential dataset to which you want messages related to custom font installation to be written.

**XOAF059E MISSING REQUIRED ENTRY  
ENTER IBM FONT LIBRARY NAME AT THE CURSOR POSITION.**

Explanation: You did not enter the name of the library that contains the IBM fonts.

System response: The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.

User action: Enter the name of the library that contains the IBM fonts.

**XOAF080E ITEM NO LONGER EXISTS  
THE SELECTED ITEM WAS DELETED PREVIOUSLY FROM THE LIST.**

Explanation: While updating a resident resource list, you typed D to the left of a resource name that has already been deleted during this session, or you entered D next to a blank name field.

System response: The cursor is positioned on the command line. **\*\*ERROR\*\*** is displayed to the right of the field in error.

User action: None required. Do not attempt to delete the same name twice within the same update session. To remove a deleted resource name from the list, you must exit the panel.

**XOAF081E ITEM ALREADY EXISTS  
THE ITEM THAT WAS TO BE ADDED ALREADY EXISTS IN THE LIST.**

Explanation: While creating or updating a resident resource list, you attempted to add a name that is already present in the list.

System response: The cursor is positioned on the name in error. No further processing is permitted until the error is corrected.

User action: Delete the duplicate name, then continue creating or updating the list.

**XOAF082E INVALID COMMAND ENTERED  
value IS AN INVALID VALUE FOR COMMAND.**

OR

**INVALID UNITS ENTERED  
value IS AN INVALID VALUE FOR UNITS.**

Explanation: While creating or updating a paper name table, you either entered an invalid command to select an item in a paper name table or you entered an invalid value for the 'Unit Measure' field.

System response: The cursor is positioned on the command line or 'Unit Measure' field. No further processing is permitted until the error is corrected.

User action: Enter a valid value as stated on the corresponding help panel.

**XOAF083E    INVALID COMMAND  
"D" (DELETE) IS THE ONLY VALID COMMAND.**

Explanation:    While updating a resident resource list, you entered an invalid command to the left of a resource name.

System response:    The cursor is positioned on the command line.

User action:    Enter **D** to the left of the resource name you want to delete.

**XOAF084E    INVALID COMMAND  
"A" (ADD) IS THE ONLY VALID COMMAND.**

Explanation:    While updating a resident resource list, you entered an invalid command on the command line.

System response:    The cursor is positioned on the command line.

User action:    Enter **A** on the command line to add an item to the list.

**XOAF085W    *dimension* ALTERED  
PRESS ENTER TO CONFIRM THE ADJUSTED *dimension*.**

Explanation:    While creating or updating a paper name table, you entered a value for the 'Width' and/or 'Height' fields that cannot be converted into a whole number in DOTS.

System response:    The page dimension is rounded up or down to the closest value which can be converted to a whole number in DOTS.

User action:    Press **ENTER** to confirm the adjusted value(s).

**XOAF086E    INVALID OUTPUT DATASET NAME ENTERED  
NO OUTPUT MEMBER CAN BE SPECIFIED WHEN USING A WILD CARD AS INPUT.**

Explanation:    In the XOAF execution of the load centralized logos command, an error was encountered. The input member name that was specified was the wildcard asterisk (\*). The output member name that was specified was a specific resource name. When using the wildcard as input, the member name should not be specified.

System response:    The short version of the message is displayed. If you enter the PF1 key, the long version of the message is displayed.

User action:    If the input member name needs to be the wildcard, the output member should not be specified. If the output member name needs to be specified, a single input member name should be specified as well.

**XOAF087I    NOTHING ADDED  
NO ITEMS WERE ENTERED IN THE INPUT PANEL.**

Explanation:    While updating a resident resource list, you pressed ENTER but did not make any entries on the Updating List panel.

System response:    The system returns to the previous panel.

User action:    None required.

**XOAF500I      TABLE OVERFLOW  
TABLE OF XOSF ADDRESS SPACES HAS OVERFLOWED. INFORMATION IGNORED.**

Explanation:    A maximum of 255 printers can be displayed. That maximum limit has been exceeded.

System response:    No processing occurs.

User action:    Check the number of printers allocated to the system. If the number is greater than 255, call Xerox Technical Support.

**XOAF501E      SECURITY ERROR  
CODE IS *message code*.**

Explanation:    This is a security error.

System response:    No processing occurs.

User action:    Check your system log or operator console for messages from your security package and correct the access authorization. If the problem persists, call Xerox Technical Support.

**XOAF502E      AUTHORIZATION FAILED  
ACCESS TO THE *code* FUNCTION REFUSED BY INSTALLATION SECURITY.**

Explanation:    This is a security error.

System response:    No processing occurs.

User action:    Check your system log or operator console for messages from your security package and correct the access authorization. If the problem persists, call Xerox Technical Support.

**XOAF504E      XOAF GETMAIN ERROR  
INCREASE REGION SIZE.**

Explanation:    The region size is insufficient.

System response:    No processing occurs.

User action:    Increase the region size and retry the option. If the problem persists, call Xerox Technical Support.

**XOAF505E      ISPF SERVICE ERROR  
THIS IS AN INTERNAL ERROR.**

Explanation:    XOAF encountered an ISPF internal error.

System response:    No processing occurs.

User action:    Contact your system administrator concerning possible problems with ISPLINK.

**XOAF506E      INVALID XSTCB ADDRESS  
THIS IS AN INTERNAL ERROR.**

Explanation:    XOAF encountered an invalid address for the XSTCB control block.  
System response:    No processing occurs.  
User action:    Call Xerox Technical Support.

**XOAF507E      INVALID XOAWORK ADDRESS  
THIS IS AN INTERNAL ERROR.**

Explanation:    XOAF encountered an invalid address for its work area.  
System response:    No processing occurs.  
User action:    Call Xerox Technical Support.

**XOAF508E      INVALID XOAPRMS ADDRESS  
THIS IS AN INTERNAL ERROR.**

Explanation:    XOAF encountered an invalid address for the XOAPRMS control block.  
System response:    No processing occurs.  
User action:    Call Xerox Technical Support.

**XOAF509E      INVALID ISPLINK ADDRESS  
THIS IS AN INTERNAL ERROR.**

Explanation:    XOAF encountered an invalid address for ISPLINK.  
System response:    No processing occurs.  
User action:    Call Xerox Technical Support.

**XOAF511E      MISSING REQUIRED ENTRY  
YOU MUST ENTER A VALUE IN EITHER THE TYPE OR DATASET NAME FIELD.**

Explanation:    While completing the panel to initiate a PDS refresh request, you pressed ENTER but did not make an entry in either the 'Type' or 'Dataset Name' fields.  
System response:    The cursor is positioned on the 'Type' field. No further processing is permitted until the error is corrected.  
User action:    Enter either a valid resource type or the name of a dataset in which PDS directories to be refreshed are located.

**XOAF512E    INVALID TYPE  
ENTER A VALID TYPE AT THE CURSOR POSITION.**

- Explanation: While completing the panel to initiate a PDS refresh request, you entered an invalid value in the 'Type' field.
- System response: The cursor is positioned on the invalid type. No further processing is permitted until the error is corrected.
- User action: Enter one of these values: FONT, FORMDEF, OVERLAY, PAGEDEF, PAGESEG, PAGEFORM, or ALL.

**XOAF513E    MISSING REQUIRED ENTRY  
IF YOU ENTER A TYPE, YOU MUST ALSO ENTER A PRINTER OR JOB NAME.**

- Explanation: While completing the panel to initiate a PDS refresh request, you entered a valid resource type, but did not specify a printer or job name.
- System response: The cursor is positioned on the 'XOSF Job Name' field. No further processing is permitted until the error is corrected.
- User action: Enter the job name of the XOSF address space, or enter the name of the printer for which PDS directories are to be refreshed.

**XOAF514E    INVALID JOB NAME  
THE JOB NAME MUST FOLLOW STANDARD z/OS NAMING CONVENTIONS.**

- Explanation: While completing the panel to initiate a PDS refresh request, you entered an invalid XOSF job name.
- System response: The cursor is positioned on the 'XOSF Job Name' field. No further processing is permitted until the error is corrected.
- User action: Enter a job name that conforms to z/OS naming conventions.

**XOAF515E    INVALID PRINTER NAME  
THE PRINTER NAME MUST FOLLOW STANDARD z/OS NAMING CONVENTIONS.**

- Explanation: While completing the panel to initiate a PDS refresh request, you entered an invalid printer name.
- System response: The cursor is positioned on the 'Printer Name' field. No further processing is permitted until the error is corrected.
- User action: Enter a printer name that conforms to z/OS naming conventions.

**XOAF516E    CONFLICTING ENTRIES  
IF YOU ENTER A PRINTER NAME, DO NOT ENTER A JOB NAME.**

- Explanation: While completing the panel to initiate a PDS refresh request, you entered a type, an XOSF job name, and a printer name.
- System response: The cursor is positioned on the 'Printer Name' field. No further processing is permitted until the error is corrected.
- User action: Delete either the XOSF job name or the printer name.

**XOAF517E      CONFLICTING ENTRIES**  
**IF YOU ENTER A DATASET NAME, DO NOT ENTER A PRINTER OR JOB NAME.**

Explanation: While completing the panel to initiate a PDS refresh request, you entered a dataset name and either an XOSF job name or a printer name.

System response: The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.

User action: If you want to perform the refresh for a dataset, delete the XOSF job name and printer name. If you want to perform the refresh for a type of resource, delete the dataset name and enter a valid resource type.

**XOAF518E      CONFLICTING ENTRIES**  
**IF YOU ENTER A TYPE, DO NOT ENTER A DATASET NAME.**

Explanation: While completing the panel to initiate a PDS refresh request, you entered both a type and a dataset name.

System response: The cursor is positioned on the 'Dataset Name' field. No further processing is permitted until the error is corrected.

User action: If you want to perform the refresh for a dataset, delete the 'Type' field entry. If you want to perform the refresh for a type of resource, delete the dataset name.

**XOAF519E      INVALID DATASET NAME**  
**THE DATASET NAME MUST FOLLOW STANDARD z/OS NAMING CONVENTIONS.**

Explanation: While completing the panel to initiate a PDS refresh request, you entered a dataset name that does not conform to standard z/OS naming conventions.

System response: The cursor is positioned on the invalid dataset name. No further processing is permitted until the error is corrected.

User action: Correct the dataset name.

**XOAF520I      *number of requests refreshes* SCHEDULED**  
***number of requests* REFRESH REQUESTS *have/have not* BEEN SCHEDULED IN XOSF.**

Explanation: The requested resource refresh was/was not requested in XOSF.

System response: Processing continues.

User action: None required.

**XOAF521E      JOB NOT FOUND**  
**ONE OR MORE JOB NAMES EXPECTED BUT NOT FOUND. *number of requests* SCHEDULED.**

Explanation: The expected job name was not found.

System response: The refresh requested for the job or printer was terminated.

User action: Correct the entry then try to schedule a refresh again.

**XOAF522E UNKNOWN RESOURCE TYPE  
DATASET ALLOCATED WITH UNKNOWN RESOURCE TYPE. *number of requests*  
SCHEDULED.**

Explanation: The resource type could not be identified.

System response: A dataset with an unknown resource type has been allocated. Refresh has been scheduled.

User action: Check the resource type and dataset.

**XOAF523E REFRESH FAILURE  
ONE OR MORE REFRESHES FAILED. *number of requests* REFRESHES SCHEDULED.**

Explanation: One or more refreshes failed.

System response: The refresh requests were completed with at least one failure.

User action: Check the log messages that relate to the refresh request. Make whatever corrections are needed.

**XOAF524I NOT A RESOURCE LIBRARY  
THE DATASET WAS NOT FOUND ALLOCATED TO ANY XOSF AS A RESOURCE PDS.**

Explanation: The named dataset was not allocated to XOSF as a resource library.

System response: The requested function is not performed.

User action: Check the validity and the spelling of the dataset name. If the problem persists, call Xerox Technical Support.

**XOAF525I REFRESH FAILURE  
REFRESH WAS REQUESTED FOR AN INACTIVE JOB OR PRINTER.**

Explanation: The refresh request called for either a job or a printer that could not be located.

System response: The request is terminated.

User action: Verify that the job name or printer name was entered correctly. If the printer or XOSF is not started, refresh is not necessary.

**XOAF526E INTERNAL ERROR  
XOAF PROTOCOL ERROR. TYPE FOUND WITHOUT XOSF OR PRINTER.**

Explanation: This is an XOAF internal protocol error.

System response: The refresh is terminated.

User action: Call Xerox Technical Support.

**XOAF527E    PROTOCOL ERROR**  
**THIS IS AN INTERNAL ERROR. THE ERROR CODE IS *error code*.**

Explanation:    This is an internal protocol error.  
System response:    The refresh is terminated.  
User action:    Contact your system administrator with all related messages. If the problem persists, call Xerox Technical Support.

**XOAF528I    REFRESH IN PROGRESS**  
**A REFRESH HAS ALREADY BEEN SCHEDULED. NO QUEUING IS PERMITTED.**

Explanation:    No queuing is allowed while a refresh is in progress.  
System response:    The already scheduled refresh continues.  
User action:    Wait until the current processing is complete before queuing another refresh.

**XOAF529E    XOSF BUSY REFRESHING**  
**REFRESH IS ALREADY ACTIVE FOR A DIRECTORY. TRY AGAIN LATER.**

Explanation:    No display or refresh is allowed while an XOSF refresh is in progress. The REFRESH command is already active.  
System response:    The already scheduled refresh continues.  
User action:    Wait until the current refresh is finished before reissuing the request.

**XOAF530E    GQSCAN ERROR *error code***  
***error code* CODE FROM GQSCAN SERVICE.**

Explanation:    This is an internal error.  
System response:    The request is terminated.  
User action:    Call Xerox Technical Support.

**XOAF531I    NO XOSF FSS ACTIVE**  
**THERE ARE NO ACTIVE XOSF FUNCTIONAL SUBSYSTEMS TO DISPLAY.**

Explanation:    There are no active XOSF FSSs to display.  
System response:    The request is terminated.  
User action:    Contact your system administrator. If your system administrator indicates that an XOSF is active, call Xerox Technical Support.

**XOAF900I      JOB STEP GENERATED  
MAKE ANY NECESSARY DSNAMES PREFIX OR JOB CARD ENTRIES.**

Explanation: This message identifies the information that XOAF requires to generate the JCL for a batch job.

System response: Processing continues.

User action: None required. However, if the panel is missing the necessary library prefixes and/or job card information, you will receive an error message when you attempt to continue.

**XOAF904I      JOB STEP GENERATED  
IMAGE CONVERSION FROM *input dataset* TO *output dataset*.**

Explanation: All members of the input dataset will be converted from an IBM page segment to a Xerox image.

System response: Processing continues.

User action: None required.

**XOAF916E      DATASET NOT FOUND  
THE INPUT DATASET COULD NOT BE FOUND.**

Explanation: XOAF could not locate the dataset name you entered in the 'INPUT Dataset Name' field.

System response: No further processing is permitted until the error is corrected.

User action: Verify that you spelled the name correctly. If you do not want the dataset name to be prefixed with your user ID, enter the fully qualified dataset name in single quotes.

**XOAF917E      INVALID INPUT DATASET  
THE INPUT DATASET ORGANIZATION MUST BE PO.**

Explanation: You entered the name of a sequential dataset or native library in the 'INPUT Dataset Name' field. The input dataset must be a PDS.

System response: No further processing is permitted until the error is corrected.

User action: Enter the name of the PDS that contains the resource to be processed.

**XOAF919E      INTERNAL ISPF ERROR  
RETURN CODE *return code* FROM *function* DIALOG SERVICE.**

Explanation: This is an ISPF or XOAF internal error.

System response: The XOAF System Services menu is redisplayed.

User action: If you cannot resolve any XOAF problems, call Xerox Technical Support.

**XOAF950I      FUNCTION CANCELED  
CREATION OF LIST *list name* CANCELED AT USER'S REQUEST.**

Explanation: While creating a resident resource list, you entered CAN or CANCEL on the command line.

System response: The identified resource list is not created. The system returns to the previous panel.

User action: None required.

**XOAF951E      INVALID DATASET NAME  
THE LOG DATASET NAME MUST BE A VALID NAME OR MUST BE LEFT BLANK.**

Explanation: While completing the panel to convert page segments to .IMG format, you entered an invalid dataset name in the 'Message Dataset Name' field.

System response: The cursor is positioned on the invalid dataset name. No further processing is permitted until the error is corrected.

User action: If you want messages to be logged, enter the name of a valid message dataset. This can be the XOAF log dataset, or a sequential dataset with these file specifications:

RECFM=VB  
LRECL=256  
BLKSIZE=4096

If you do not want messages to be logged, leave the 'Message Dataset Name' field blank and delete the XPAFXLOG DD statement from the XRF BATCH generated JCL.

**XOA001E      INVALID OPTION  
ENTER "B", "S", OR "D".**

Explanation: You entered an invalid option for an XOAF directory list.

System response: The cursor is positioned on the invalid entry. No further processing is permitted until the error is corrected.

User action: Enter **B** or **S** to browse a member, or **D** to delete a member.

**XOA002E      PF3/END IS NOT VALID  
ENTER "C" ON THE COMMAND LINE TO LEAVE THIS PANEL.**

Explanation: Entering END or pressing PF3 is not a valid response for this panel.

System response: The cursor is positioned on the command line. No further processing is permitted until the error is corrected.

User action: Enter **C** on the command line to leave the panel.

## XPA messages

---

**XPA9009E**    *program - AN INVALID FUNCTION -- command -- WAS REQUESTED*

Explanation:    This is an internal error.

System response:    After logging this message and returning it to the caller in XPRMSGT,  
the parsing request stops with a return code of hexadecimal 20.

User action:    Call Xerox Technical Support.

## XPC messages

---

### **XPC0001I THE MAXIMUM NUMBER OF 16 HORIZONTAL TABS HAS BEEN EXCEEDED**

Explanation: The number of horizontal tabs specified during XES-to-PCL conversion exceeds the maximum allowable number.

System response: Only the first 16 horizontal tabs are recognized. Document processing continues.

User action: Call Xerox Technical Support.

### **XPC0002I XPCL MODE SELECTED FOR - *jobname***

Explanation: This message provides supplemental information to assist in debugging. It is issued only if intensive logging is turned on.

System response: Document processing continues.

User action: None required.

### **XPC2124E ERROR READING LIBRARY *ddname dsname*. LDM RC=X'return code'; IC=X'information code'**

Explanation: A VSAM read error occurred while accessing the named library.

System response: Document processing is terminated.

User action: Make a note of the return codes. If the problem persists, call Xerox Technical Support.

### **XPC3010F COULD NOT GET X'*storage size*' BYTES OF MEMORY *activity***

Explanation: Insufficient storage was available for the conversion routine to obtain the requested amount for the required data buffer.

System response: The resource cannot be converted. Document processing is terminated. The document remains in the output buffer.

User action: Increase the region size allocated to the XOSF start-up proc or drain the other printers, then retransmit the document. If the problem persists, call Xerox Technical Support.

### **XPC3011E COULD NOT RELEASE X'*storage size*' BYTES OF MEMORY FROM LOCATION X'*storage address*' *activity***

Explanation: The storage used for transformation processing was not released, and the document may be incorrect. This is an internal error.

System response: Document processing is terminated.

User action: Call Xerox Technical Support.

**XPC4142W XES INLINE FONT AREA EXCEEDED. INLINE FONT WILL BE IGNORED.**

Explanation: An XES inline font was encountered that exceeded the allowable font size.

System response: The XES font is discarded. Processing continues.

User action: If this is an XES document, ensure that all fonts are separated by an <esc>+F or an <esc>+A, otherwise contact Xerox Technical Support.

**XPC4143E XES INLINE FONT TABLE EXCEEDED. DOCUMENT WILL BE ABORTED.**

Explanation: An XES inline resource was encountered that required more than 4MB of internal storage.

System response: The document is aborted.

User action: Contact Xerox Technical Support.

**XPC414FE XPCLMAIN BUFFER CAPACITY EXCEEDED**

Explanation: The maximum amount of data that can be contained within the XES-to-PCL conversion buffer has been exceeded. This is an internal error.

System response: Document processing is terminated.

User action: Call Xerox Technical Support.

**XPC4144E RESOURCE FRAGMENT DETECTED, BUT NO RESOURCE LOAD IN PROGRESS.**

Explanation: An internal processing error has occurred.

System response: The document is aborted.

User action: Contact Xerox Technical Support.

**XPC6307E MINOR ERROR ENCOUNTERED BY *module name* DURING *command* LDM *command description* PROCESSING. RC=X'*return code*'; IC=X'*information code*'. UNABLE TO *command* FILE DDNAME *ddname*, FOR type RESOURCE NAMED *member name***

Explanation: This is an internal error.

System response: The conversion of the Xerox resource to a PCL resource is not directly affected by this error. If *command* is FLCA, the preceding allocation failure may affect the final outcome of the document.

User action: Make a note of the return codes. If the problem persists, call Xerox Technical Support.

**XPC6393W    WARNING MESSAGE ISSUED BY XPCLMAIN DURING XES-TO-PCL PROCESSING, DUE TO INVALID RETURN CODE FOR XES COMMAND** *escape sequence*

Explanation:    During XES-to-PCL conversion, an invalid escape sequence has been detected.

System response:    The invalid escape sequence is ignored, and document processing continues.

User action:    Ensure that the escape sequence is valid and that the XES data stream has been created correctly. If the escape sequence appears to be valid, call Xerox Technical Support.

**XPC7700E    MULTI LANGUAGE SUPPORT RETURNED AN ERROR, R15=***return code*

Explanation:    An error was found in a sublevel function.

System response:    Document processing is terminated, and the document is held on the output queue.

User action:    Correct any problems identified by preceding messages. If the problem persists, call Xerox Technical Support.

**XPC7701E    *member name* MEMBER IS NOT FOUND IN DDNAME** *ddname R15=return code*

Explanation:    An XES command called for a resource from the PCL libraries, but the resource was not found.

System response:    Document processing is terminated, and the document is held on the output queue.

User action:    If the named resource has been deleted, recreate the resource using the required transform. If you cannot determine the problem from this and previously issued error messages, call Xerox Technical Support.

**XPC7702I    XES LICENSED FONT** *font name* **IS BEING CONVERTED TO TRANSIENT PCL FORMAT FOR JOB** *job name*

Explanation:    During XES-to-PCL conversion, licensed fonts are converted into a PCL transient format to be used by the PCL transform.

System response:    None.

User action:    None

**XPC7703E      DOCUMENT *jobid* CONTAINS DATA IN THE PCL NONPRINTABLE AREA. DATA HAS BEEN REPOSITIONED**

- Explanation:      During XES-to-PCL conversion, data was detected in the PCL nonprintable area.
- System response:      Processing continues. The beginning print position of this data has been adjusted. Data will now print offset.
- User action:      This is a PCL restriction. Some PCL-capable printers have a non-printable margin along each edge of the page of up to 75 dots. This margin varies depending on page size and orientation. For printers with this limitation, XPAF does not generate any data in this area and repositions the data into the printable area. The output will appear different than when printed on a decentralized printer. To resolve this problem, modify your application to place all data into the PCL printable area.

**XPC7704E      *error type* ERROR DURING *command* LDM *command description* PROCESSING. RC=*X*'return code'; IC=*X*'information code'. UNABLE TO *activity* FILE DDNAME *ddname* FOR *type* RESOURCE NAMED *member name***

- Explanation:      During XES-to-PCL conversion, the named resource could not be found.
- System response:      Document processing is terminated, and the document remains in the output queue.
- User action:      If *command* is either PUT or STOW, see if the named library is full. Other messages should precede this message and provide more information. If the problem persists, call Xerox Technical Support.

## XPD messages

---

### **XPD1104E PDF FONT SUBSTITUTION ERROR: UNABLE TO OPEN SUBSTITUTION TABLE**

Explanation: During XES-to-PDF conversion, XOSF was unable to open the PDF font substitution table.

System response: Font substitution is ignored, and document processing continues.

User action: Ensure that the table name has been specified correctly.

### **XPD3010F COULD NOT GET X'SORAGE SIZE' BYTES OF MEMORY ACTIVITY**

Explanation: Insufficient storage was available for the conversion routine to obtain the requested amount for the required data buffer.

System response: The resource cannot be converted. Document processing is terminated. The document remains in the output buffer.

User action: Increase the region size allocated to the XOSF start-up proc or drain the other printers, then retransmit the document. If the problem persists, call Xerox Technical Support.

### **XPD3011E COULD NOT RELEASE X'SORAGE SIZE' BYTES OF MEMORY FROM LOCATION X'SORAGE ADDRESS' ACTIVITY**

Explanation: The storage used for transformation processing was not released, and the document may be incorrect. This is an internal error.

System response: Document processing is terminated.

User action: Call Xerox Technical Support.

### **XPD6393W WARNING MESSAGE ISSUED BY XPDFMAIN DURING XES-TO-PDF PROCESSING, DUE TO INVALID RETURN CODE FOR XES COMMAND *ESCAPE SEQUENCE***

Explanation: During XES-to-PDF conversion, an invalid escape sequence has been detected.

System response: The invalid escape sequence is ignored, and document processing continues.

User action: Ensure that the escape sequence is valid and that the XES data stream has been created correctly. If the escape sequence appears to be valid, call Xerox Technical Support.

### **XPD0009I \*\*\* MISSING CONFIGURATION FILE**

Explanation: XPDL cannot find the configuration file to set the default parameter for the compiler.

System response: The system stops processing.

User action: Insure that the invoking JCL has the correct DD for the configuration file (DD name = CON).

**XPD0021W \*\*\*\*\* JSL CONTAINS ERROR(S) \*\*\*\*\***

Explanation: XPDL detected error(s) in a JSL it compiled.  
System response: The system continues processing.  
User action: Examine the print report for previous error messages identifying the errors encountered and correct as necessary.

**XPD0023W \*\*\*\*\* FATAL ERROR -- COMPILATION ABORTED \*\*\*\*\***

Explanation: XPDL encountered a fatal error and could not continue compiling the JSL.  
System response: The system stops processing.  
User action: Correct the problem as suggested by XPDL and recompile the JSL. If the problem still exists, contact your Xerox Representative or your system administrator.

**XPD0024W \*\*\*\*\* INTERNAL ERROR IN XPDL \*\*\*\*\***

Explanation: XPDL detected a serious error with the program.  
System response: The system stops processing.  
User action: Report the problem to your Xerox representative or your system administrator.

**XPD0025I COMPILATION COMPLETED**

Explanation: XPDL completed the compilation.  
System response: The system continues processing.  
User action: No action required.

**XPD0026W FILE LABEL GENERATION ERROR: <FILENAME> TOO LARGE**

Explanation: The output object file is too large for Xerox file format.  
System response: The system continues processing but the current file is not saved.  
User action: Reduce the commands in the JSL or break it into multiple JSL files.

**XPD0027F INTERNAL ERROR IN XPDL (AT CHECK POINT <NUMBER>)**

Explanation: XPDL detected an internal error within the program.  
System response: The system stops processing.  
User action: Contact your Xerox representative or your system administrator with the check point number reported by XPDL.

**XPD0028F      INSUFFICIENT MEMORY**

Explanation:    XPDL cannot allocate enough memory for its operation.  
System response:    The system stops processing.  
User action:    Increase the REGION size and recompile the JSL. If the problem still exists report the problem to your Xerox representative or your system administrator.

**XPD0029F      INTERNAL BUFFER ERROR**

Explanation:    XPDL detected an internal error with its buffer management.  
System response:    The system stops processing.  
User action:    Report the problem to your Xerox representative or your system administrator.

**XPD0030F      CANNOT CREATE <FILENAME>**

Explanation:    XPDL cannot create the output file.  
System response:    The system continues processing.  
User action:    Report the problem to your Xerox representative or your system administrator.

**XPD0051W      INVALID OR INCOMPLETE STATEMENT, SKIP THE COMMAND**

Explanation:    XPDL detected that the statement it encountered was either invalid or incomplete. It will disregard (skip) parsing the command.  
System response:    The system continues processing and the statement in error is ignored.  
User action:    Examine the print report for previous error messages identifying the error encountered and correct your JSL as suggested and recompile it.

**XPD0052W      PDL SKIPPING...**

Explanation:    XPDL detected an error in the command and it will disregard (skip) that command.  
System response:    The system continues processing and looks for the next PDL statement.  
User action:    Examine the print report for previous error messages identifying the error encountered and correct your JSL as suggested and recompile it.

**XPD0053W      COMMAND NOT SUPPORTED IN THIS CONFIGURATION, STR = XXX**

Explanation:    XPDL detected that the command encountered in the JSL is not supported with the PDL version selected.  
System response:    The system continues processing and looks for the next PDL statement.  
User action:    Remove the command in the JSL or select the right PCLVER and recompile the JSL.

**XPD0054W    PARAMETER NOT SUPPORTED IN THIS CONFIGURATION, STR = <PARAMETER>**

Explanation:    XPDL detected that the parameter encountered in the JSL is not supported with the PDL version selected.

System response:    The system continues processing.

User action:    Remove the parameter in the JSL or select the right PCLVER and recompile the JSL.

**XPD0055W    OPTION NOT SUPPORTED IN THIS CONFIGURATION, STR = <OPTION>**

Explanation:    XPDL detected that the option encountered in the JSL is not supported with the PDL version selected.

System response:    The system continues processing.

User action:    Remove the option in the JSL or select the right PCLVER and recompile the JSL.

**XPD0056W    PREMATURE END OF JDL OR CATALOG COMMAND SET**

Explanation:    XPDL detected unexpected end of JSL or CATALOG.

System response:    The system continues processing.

User action:    Modify the JSL as suggested and recompile it.

**XPD0057W    LABEL TOO LONG -- TRUNCATED, STR = <LABEL-NAME>**

Explanation:    The label is too long and was truncated to 6 characters.

System response:    The system continues processing.

User action:    Reduce the label to 6-characters and recompile the JSL.

**XPD0058E    INVALID LABEL DELIMITER**

Explanation:    An invalid character was used as a label delimiter.

System response:    The system continues processing.

User action:    Replace the invalid character with a colon (':').

**XPD0059E    BAD CHARACTER DETECTED, STR = <CHARACTER>**

Explanation:    XPDL encountered unexpected character, due to typographical error or corrupted file.

System response:    The system continues processing.

User action:    Remove or modify the character and recompile the JSL file.

**XPD0060E    INVALID COMMAND KEYWORD, STR = <KEYWORD>**

Explanation:    PDL encountered an invalid command keyword.  
System response:    The system continues processing.  
User action:    Remove or modify the invalid keyword and recompile the JSL file.

**XPD0061E    INVALID PARAMETER KEYWORD (LEFT PART), STR = <KEYWORD>**

Explanation:    XPDL encountered an invalid parameter keyword.  
System response:    The system continues processing.  
User action:    Remove or modify the invalid keyword and recompile the JSL file.

**XPD0062W    MISSING SEMICOLON IN JSL**

Explanation:    A semicolon is missing at the end of the command.  
System response:    The system continues processing.  
User action:    Insert the semicolon as suggested and recompile the JSL file.

**XPD0063E    NESTING OF OPTION TOO DEEP**

Explanation:    Explanation: An option was nested in parenthesis to a depth of more than 20.  
System response:    The system continues processing.  
User action:    Remove some of the redundant parenthesis and recompile the JSL file.

**XPD0064W    UNBALANCED PARENTHESES**

Explanation:    XPDL could not find the matching right parenthesis ")".  
System response:    The system continues processing.  
User action:    Insert a right parenthesis ")" as suggested or remove the extra left parenthesis "(" and recompile the JSL file.

**XPD0065E    INVALID PARAMETER SEPARATOR**

Explanation:    An invalid character was used to separate a parameter from its options.  
System response:    The system continues processing.  
User action:    Correct the invalid delimiter and recompile the JSL. Valid parameter delimiters are: comment, new line, comma and space.

**XPD0066E    INVALID PARAMETER DELIMITER**

Explanation:    An invalid character was used to separate two parameters.  
System response:    The system continues processing.  
User action:    Correct the invalid delimiter and recompile the JSL. Valid parameter delimiters are: comment, new line, comma and space.

**XPD0067E    INVALID OPTION DELIMITER**

Explanation:    An invalid character was used to separate two options.  
System response:    The system continues processing.  
User action:    Correct the invalid delimiter and recompile the JSL. Valid parameter delimiters are: comment, new line, comma and space.

**XPD0068E    EQUAL SIGN OR LEFT PARENTHESIS IS REQUIRED BETWEEN PARAMETER AND OPTION**

Explanation:    XPDL detected that there is no equal sign "=" or left parenthesis "(" between the parameter and its option.  
System response:    The system continues processing.  
User action:    Insert an equal sign or a left parenthesis between the parameter and its option as suggested and recompile the JSL.

**XPD0069W    MISSING CLOSE QUOTE IN JSL**

Explanation:    XPDL could not find the matching close quote.  
System response:    The system continues processing.  
User action:    Insert a close quote at the appropriate location and recompile the JSL file.

**XPD0070W    CATALOG CONTAINS ERROR(S), STR = <CATALOG-NAME>**

Explanation:    XPDL detected an error(s) in a catalog.  
System response:    The system continues processing.  
User action:    Modify the catalog as suggested and recompile the JSL.

**XPD0071E    INVALID OPTION, STR = <OPTION>**

Explanation:    The option is not a valid one for the parameter.  
System response:    The system continues processing.  
User action:    Remove the invalid option or modify it so that it is a valid option for the parameter and recompile the JSL.

**XPD0072E    INVALID NULL OPTION**

Explanation:    The null option is not allowed for this parameter.  
System response:    The system continues processing.  
User action:    Insert a valid option for this parameter and recompile the JSL.

**XPD0073E    NEGATIVE VALUE NOT ALLOWED**

Explanation:    A negative value is not allowed for this parameter.  
System response:    The system continues processing.  
User action:    Modify the value so it becomes a positive number and recompile the JSL.

**XPD0074W    INCOMPLETE OR INVALID LEFT/RIGHT PART**

Explanation:    XPDL detected an incomplete or invalid left or right part of the parameter.  
System response:    The system continues processing.  
User action:    Modify JSL as suggested and recompile the JSL file.

**XPD0075E    TOO MANY OPTIONS, OPTION IGNORE, STR = <OPTION>**

Explanation:    XPDL detected that too many options are used for the parameter.  
System response:    The system continues processing.  
User action:    Remove the extra options and recompile the JSL file.

**XPD0076E    UNRECOGNIZED OPTION KEYWORD, STR = <OPTION>**

Explanation:    An invalid option keyword was encountered for the parameter.  
System response:    The system continues processing.  
User action:    Remove or modify the option and recompile the JSL file.

**XPD0077E    INVALID NULL STRING**

Explanation:    A null string is not allowed for this option.  
System response:    The system continues processing.  
User action:    Remove or modify the option and recompile the JSL file.

**XPD0078W    USER TABLE NOT DEFINED**

Explanation:    A reference was made to a user-defined PCC table, but the table was not defined in the JSL.  
System response:    The system continues processing.  
User action:    Remove the reference or define the PCC table and recompile the JSL file.

**XPD0079W      REQUIRED LABEL NOT FOUND**

Explanation:    The PDL command requires a label that was not specified.  
System response:    The system continues processing.  
User action:    Insert a label for the erroneous PDL command and recompile the JSL file.

**XPD0080W      DUPLICATE LABEL ENCOUNTERED, STR = <LABEL-NAME>**

Explanation:    XPDL encountered a duplicate label for the same command, such as two or more PDE commands having the same label.  
System response:    The system continues processing.  
User action:    Rename one or more of the labels and recompile the JSL file.

**XPD0081I      REFERENCED LABEL TOO LONG -- TRUNCATED, STR = <LABEL-NAME>**

Explanation:    The label referenced was too long; XPDL truncated it to a six-character name.  
System response:    The system continues processing.  
User action:    Verify the label is correct or modify it to only 6 characters and recompile the JSL file.

**XPD0082E      REFERENCED LABEL NOT FOUND, STR = <LABEL-NAME>**

Explanation:    The label referenced was not found in the JSL.  
System response:    The system continues processing.  
User action:    Modify the command to reference an existing label, or add a command with the specified label and recompile the JSL file.

**XPD0083E      INVALID LABEL, LABEL REQUIRED AT LEAST 1 ALPHA CHAR, STR = <LABEL-NAME>**

Explanation:    The label entered is invalid. The label needs to have at least one alpha character "a...zA...Z".  
System response:    The system continues processing.  
User action:    Modify the label to have at least one alpha character and recompile the JSL file.

**XPD0084E      DUPLICATE TABLE ENCOUNTERED, STR = <TABLE-NAME>**

Explanation:    XPDL detected that the JSL source contains two tables with the same name.  
System response:    The system continues processing.  
User action:    Rename one of the tables to a different name and recompile the JSL file.

**XPD0085W    DUPLICATE LABEL ENCOUNTERED, JOB STATEMENTS IGNORED, STR = <LABEL-NAME>**

Explanation:    XPDL detected that there were two JOB statements with the same name.  
System response:    The system continues processing.  
User action:    Rename one of the JOB statements and recompile the JSL file.

**XPD0086W    USER TABLE ALREADY EXISTS, STATEMENT IGNORED**

Explanation:    More than one table was defined without a label when only one unlabeled table is allowed.  
System response:    The system continues processing.  
User action:    Label all tables except the table functioning as the default and recompile the JSL file.

**XPD0087E    MAXIMUM STRING SIZE EXCEEDED**

Explanation:    The number of characters in the string exceeds the string size limit for the option.  
System response:    The system continues processing.  
User action:    Reduce the number of characters in the string and recompile the JSL file.

**XPD0088E    VALUE SPECIFIED IS OUT OF RANGE, STR = <VALUE>**

Explanation:    The value specified is out of range for the option.  
System response:    The system continues processing.  
User action:    Correct the value and recompile the JSL file.

**XPD0089E    VALUE SPECIFIED IS OUT OF RANGE**

Explanation:    The value specified is out of range for the option.  
System response:    The system continues processing.  
User action:    Correct the value and recompile the JSL file.

**XPD0094W    PREVIOUS ASSIGNMENTS LOST**

Explanation:    ASSIGN or TASSIGN specifications preceding the DEFAULT parameter are ignored.  
System response:    The system continues processing.  
User action:    If the ASSIGN or TASSIGN specifications are to be included in the table, recode the command with the ASSIGN or TASSIGN specifications following the DEFAULT parameter; otherwise, remove them and recompile the JSL file.

**XPD0095E    EXTRA BOFACT ENCOUNTERED. PREVIOUS BOFACT LOST**

Explanation:    A repeated Before-Print-Action PCC specification overwrites the previous specification.

System response:    The system continues processing.

User action:    Remove the unwanted Before-Print-Action PCC specification and recompile the JSL file.

**XPD0096W    IMPROPER BRACKETING OF ASSIGN STATEMENT**

Explanation:    The options for the PCC ASSIGN parameter do not conform to the syntax.

System response:    The system continues processing.

User action:    Refer to the PDL/DJDE Reference for your printer for the correct syntax and recompile the JSL file.

**XPD0097W    STRING CONSTANT MUST BE OF SAME LENGTH**

Explanation:    Comparison strings in the TABLE CONSTANT parameter must all be of the same string length.

System response:    The system continues processing.

User action:    Correct the comparison strings in the TABLE CONSTANT parameter and recompile the JSL file.

**XPD0098W    CRITERIA CONSTANT OR CHANGE IS MISSING, INCOMPLETE STATEMENT -- IGNORED**

Explanation:    A CRITERIA command is missing a CONSTANT or CHANGE parameter.

System response:    The system continues processing.

User action:    Specify a CONSTANT or CHANGE parameter for the CRITERIA command and recompile the JSL file.

**XPD0099W    ANDED CRITERIA LINE RANGES DO NOT OVERLAP**

Explanation:    The two referenced CRITERIA commands with an AND condition do not have an overlap in their line range.

System response:    The system continues processing.

User action:    Either correct the line range of the referenced CRITERIA commands or change the logical operation and recompile the JSL file.

**XPD0100W    WARNING: PRINT OPTION IGNORED WITH DELIMITER=NO**

Explanation:    RSTACK DELIMITER=NO was specified so the PRINT parameter is ignored.

System response:    The system continues processing.

User action:    Refer to the PDL/DJDE Reference for your printer, for the correct combination of parameters required for your needs and recompile the JSL file.

**XPD0101W    MISSING CRITERIA**

Explanation:    A referenced CRITERIA command is missing.

System response:    The system continues processing.

User action:    Correct the CRITERIA reference or add a new CRITERIA command with the same name as the referenced one and recompile the JSL file.

**XPD0102W    CRITERIA FIELD AND TABLE CONSTANT LENGTHS DO NOT MATCH**

Explanation:    The lengths of the compare specified in the CRITERIA command and the TABLE CONSTANT do not match.

System response:    The system continues processing.

User action:    Correct the compare length in either the CRITERIA command or the TABLE CONSTANT and recompile the JSL file.

**XPD0103E    MAXIMUM ASSIGN VALUE EXCEEDED**

Explanation:    The MASK character is more than one character in length.

System response:    The system continues processing.

User action:    Correct the MASK character so that it is one character long and recompile the JSL file.

**XPD0104W    CRITERIA TABLE NOT GENERATED**

Explanation:    Due to previous error(s), the criteria table is not generated and may not be referenced.

System response:    The system continues processing.

User action:    Correct the previous error(s) as indicated in the listing file and recompile the JSL file.

**XPD0105W    DUPLICATE FONT LIST**

Explanation:    Multiple FONTS parameters were specified.

System response:    The system continues processing.

User action:    Remove the redundant FONTS parameters or merge the parameters into one and recompile the JSL file.

**XPD0106W    TOO MANY FONT SPECIFIED**

Explanation:    The number of fonts in the font list exceeds the maximum allowed.  
System response:    The system continues processing.  
User action:    Reduce the number of fonts used in the font list and recompile the JSL file.

**XPD0107W    BEGIN HORIZONTAL VALUE OUT OF RANGE**

Explanation:    The horizontal value for the BEGIN statement is out of range.  
System response:    The system continues processing.  
User action:    Modify the value according to the limits for each PDL version and recompile the JSL file.

**XPD0108W    BEGIN VERTICAL VALUE OUT OF RANGE**

Explanation:    The vertical value for the BEGIN statement is out of range.  
System response:    The system continues processing.  
User action:    Modify the value according to the limits for each PDL version and recompile the JSL file.

**XPD0109W    TOO MANY BEGIN SPECIFIED**

Explanation:    The number of BEGIN exceeds the limit allowed.  
System response:    The system continues processing.  
User action:    Reduce the number of BEGIN statements to be within the limits allowed and recompile the JSL file.

**XPD0110W    MISSING FONT -- PDE STATEMENT IGNORED**

Explanation:    The FONTS parameter is missing, or no fonts were specified.  
System response:    The system continues processing.  
User action:    Correct the FONTS parameter or add a FONTS parameter to the PDE command and recompile the JSL file.

**XPD0111W    BEGIN VALUES MUST BE IN PAIR**

Explanation:    An odd number of options were specified in the BEGIN parameter instead of the required two.  
System response:    The system continues processing.  
User action:    Correct the BEGIN parameter or remove the statement from the JSL and recompile the JSL file.

**XPD0112E COPY RANGE ERROR, STR = <VALUE>**

Explanation: The passno option specified for the ROUTE RTEXT parameter is invalid or out of range.

System response: The system continues processing.

User action: Refer to the PDL/DJDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0113E LINE RANGE ERROR, STR = <VALUE>, RTEXT FIELD IGNORED**

Explanation: The line option specified for the ROUTE RTEXT parameter is invalid or out of range.

System response: The system continues processing.

User action: Refer to the PDL/DJDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0114W CHANNEL ASSIGNMENT IN LINE NUMBER EXCEEDS BOF**

Explanation: The line number in the ASSIGN parameter exceeds the BOF.

System response: The system continues processing.

User action: Reduce the line number to be within the BOF value or increase the BOF to be greater than the line number assignment and recompile the JSL file.

**XPD0115W MINLAB LENGTH MUST BE LESS THAN MAXLAB LENGTH**

Explanation: The value of the MINLAB length is greater than the value of the MAXLAB length.

System response: The system continues processing.

User action: Reduce the value of the MIN LAB length or increase the value of the MAXLAB length so that the MAXLAB length is greater than the MINLAB length and recompile the JSL file.

**XPD0116W WHEN TYPE SPEC IS SPECIFIED AS A SERIES OF CHARS, 0 IS NOT ALLOWED**

Explanation: Specifying 0 is not allowed when TYPE SPEC is specified as a series of characters.

System response: The system continues processing.

User action: Refer to the PDL/DJDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0124I      WARNING: "NTO1=YES" NOT ALLOWED WITH "FACEUP=NO"**

Explanation:      The value YES for parameter NTO1 cannot coexist with the value NO for the parameter FACEUP.

System response:      The system continues processing.

User action:      Change YES to NO for NTO1, or NO to YES for FACEUP (according to your needs) and recompile the JSL file.

**XPD0125I      WARNING: JOB WILL USE "NTO1=YES,FACEUP=YES"**

Explanation:      The system will use "NTO1=YES,FACEUP=YES" for the output JDL.

System response:      The system continues processing.

User action:      Make sure that "NTO1=YES,FACEUP=YES" is what you want for your JDL. Otherwise correct your JSL according to the previous message and recompile the JSL file.

**XPD0126I      WARNING: "NTO1=YES" NOT ALLOWED WITH "COLLATE=NO"**

Explanation:      The value YES for parameter NTO1 cannot coexist with the value NO for the parameter COLLATE.

System response:      The system continues processing.

User action:      Change YES to NO for NTO1, or NO to YES for COLLATE (according to your needs) and recompile the JSL file.

**XPD0127I      WARNING: JOB WILL USE "NTO1=YES,COLLATE=YES"**

Explanation:      The system will use "NTO1=YES,COLLATE=YES" for the output JDL.

System response:      The system continues processing.

User action:      Make sure that "NTO1=YES,COLLATE=YES" is what you want for your JDL; otherwise, correct your JSL according to the previous message and recompile the JSL file.

**XPD0128E      PAPER SIZE OUT OF RANGE**

Explanation:      The paper size specified is out of range.

System response:      The system continues processing.

User action:      Correct the paper size according the value allowed for each PDL version and recompile the JSL file.

**XPD0129W      SCALE FACTOR ERROR**

Explanation:      The scale factor is erroneous.

System response:      The system continues processing.

User action:      Refer to the PDL/DIDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0130E STOCK NAME NOT SPECIFIED**

Explanation: A stock name was not specified.  
System response: The system continues processing.  
User action: Refer to the PDL/DIDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0131E STOCK REFERENCE ALREADY ASSIGNED**

Explanation: A stock reference specified has already been assigned.  
System response: The system continues processing.  
User action: Refer to the PDL/DJDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0132E INIFEED STOCK IS UNDEFINED**

Explanation: The INIFEED stock is not defined.  
System response: The system continues processing.  
User action: Refer to the PDL/DJDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0133E SYSPAGE STOCK IS UNDEFINED**

Explanation: The SYSPAGE stock is not defined.  
System response: The system continues processing.  
User action: Refer to the PDL/DIDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0134W WARNING: STOCK NAME CONTAINS INVALID CHARACTER(S), STR = <STOCKNAME>**

Explanation: The stock-name contains invalid character(s).  
System response: The system continues processing.  
User action: Remove the invalid character(s) or substitute with valid character(s) and recompile the JSL file.

**XPD0135W JOB-ID = <JDE-NAME>: IDE DOES NOT VERIFY**

Explanation: A validation error occurred for the JDE.  
System response: The system continues processing.  
User action: Refer to the previous error messages, correct the JDE and recompile the JSL file.

**XPD0136W    JOB-ID = <JDE-NAME>:BLOCK SPACE NOT ALLOWED WITH SECURITY=YES**

Explanation:    The value YES for parameter SECURITY cannot coexist with the BLOCK command specified.

System response:    The system continues processing.

User action:    Change YES to NO for the SECURITY parameter or remove the BLOCK command and recompile the JSL file.

**XPD0137W    JOB-ID = <JDE-NAME>:DJDE SKIP VALUE EXCEEDS RECORD LENGTH**

Explanation:    The SKIP value to the DJDE must fall within the record length.

System response:    The system continues processing.

User action:    Correct the SKIP value or the record length, depending on your needs and recompile the JSL file.

**XPD0138W    JOB-ID = <JDE-NAME>:FIXED BLOCK LENGTH NOT A MULTIPLE OF RECORD LENGTH**

Explanation:    The block length specified for the IDE is not a multiple of the record length.

System response:    The system continues processing.

User action:    Correct the block or record lengths for the IDE depending on your needs and recompile the JSL file.

**XPD0139W    JOB-ID = <JDE-NAME>:INVALID HOST LABEL PAIR**

Explanation:    The specified input file label type is invalid for the specified host.

System response:    The system continues processing.

User action:    Correct the label type or host type depending on your needs and recompile the JSL file. Refer to the PDL/DIDE Reference for your printer, for the supported combinations.

**XPD0140W    JOB-ID = <JDE-NAME>:MASKED COMPARES REQUIRE A TCODE TABLE**

Explanation:    A TCODE table is required when masked compares are to be made.

System response:    The system continues processing.

User action:    Add a TCODE table or remove the masks from the compare table, depending on your needs and recompile the JSL file.

**XPD0141W    JOB-ID = <JDE-NAME>:OFFSET TO DJDE PREFIX + LENGTH EXCEEDS RECORD LENGTH**

Explanation:    The sum of the prefix and offset lengths must fall within the record length.

System response:    The system continues processing.

User action:    Correct the prefix and offset values or the record length, depending on your needs and recompile the JSL file.

**XPD0142W    JOB-ID = <JDE-NAME>:TOF EXCEEDS BOF**

Explanation:    The value of TOE exceeds the value of BOF.  
System response:    The system continues processing.  
User action:    Reduce the value of TOF or increase the value of BOF so that TOE is smaller or equal to BOF and recompile the JSL file.

**XPD0143W    JOB-ID = <JDE-NAME>:UNDEFINED BLOCKED RECORD WITH NO RECORD DELIMITER SPECIFIED**

Explanation:    A record delimiter constant must be specified for undefined blocked records.  
System response:    The system continues processing.  
User action:    Add a record delimiter constant specification or change the record structure, depending on your needs and recompile the JSL file.

**XPD0144W    JOB-ID = <JDE-NAME>:ZERO =YES REQUIRES A RECORD LENGTH FIELD SPECIFICATION**

Explanation:    The ZERO=YES specification requires an accompanying RECORD LENGTH specification.  
System response:    The system continues processing.  
User action:    Remove the ZERO = YES specification or add a RECORD LENGTH specification, depending on your needs and recompile the JSL file.

**XPD0145W    JOB-ID = <JDE-NAME>:OFFSET TO BLOCK LENGTH FIELD + LENGTH EXCEEDS BLOCK LENGTH**

Explanation:    The sum of the offset and the lthfld values must fall within the block length.  
System response:    The system continues processing.  
User action:    Correct the offset and lthfld values or the block length value, depending on your needs and recompile the JSL file.

**XPD0146W    JOB-ID = <JDE-NAME>:BLOCK LENGTH ADJUSTMENT EXCEEDS BLOCK LENGTH**

Explanation:    The block adjustment value must fall within the block length.  
System response:    The system continues processing.  
User action:    Correct the block adjustment or block length values, depending on your needs and recompile the JSL file.

**XPD0147W    JOB-ID = <JDE-NAME>:BLOCK PREAMBLE + POSTAMBLE EXCEEDS BLOCK LENGTH**

Explanation:    The sum of the preamble and postamble values must fall within the block length.

System response:    The system continues processing.

User action:    Correct the preamble and postamble values or the block length value, depending on your needs and recompile the JSL file.

**XPD0148W    JOB-ID = <JDE-NAME>:RECORD PREAMBLE + POSTAMBLE EXCEEDS RECORD LENGTH**

Explanation:    The sum of the preamble and postamble values must fall within the record length.

System response:    The system continues processing.

User action:    Correct the preamble and postamble values or the record length value, depending on your needs and recompile the JSL file.

**XPD0149W    JOB-ID = <JDE-NAME>:RECORD LENGTH EXCEEDS BLOCK LENGTH**

Explanation:    The block length must be less than or equal to, and a multiple of, the record length.

System response:    The system continues processing.

User action:    Correct the record and/or block length values, depending on your needs and recompile the JSL file.

**XPD0150W    JOB-ID = <JDE-NAME>:OFFSET TO PCC EXCEEDS RECORD LENGTH**

Explanation:    The offset to the PCC byte must fall within the record length.

System response:    The system continues processing.

User action:    Correct the PCC offset value or the record length value, depending on your needs and recompile the JSL file.

**XPD0151W    JOB-ID = <JDE-NAME>:VARIABLE RECORD WITH NO RECORD LENGTH FIELD SPECIFIED**

Explanation:    The record length is missing or incorrectly specified.

System response:    The system continues processing.

User action:    Specify or correct the record length and recompile the JSL file.

**XPD0152W    JOB-ID = <JDE-NAME>:OFFSET TO RECORD LENGTH FIELD + LENGTH EXCEEDS RECORD LENGTH**

Explanation:    The sum of the offset and the lthfld values must fall within the record length.

System response:    The system continues processing.

User action:    Correct the offset and lthfld values or the record length value, depending on your needs and recompile the JSL file.

**XPD0153W    JOB-ID = <JDE-NAME>:RECORD LENGTH ADJUSTMENT EXCEEDS RECORD LENGTH**

Explanation:    The record adjustment value must fall within the block length.

System response:    The system continues processing.

User action:    Correct the record adjustment or record length values, depending on your needs and recompile the JSL file.

**XPD0154W    JOB-ID = <JDE-NAME>:RECORD LENGTH INVALID**

Explanation:    The record length is missing or incorrectly specified.

System response:    The system continues processing.

User action:    Specify or correct the record length and recompile the JSL file.

**XPD0155W    JOB-ID = <JDE-NAME>:"VOLUME CODE=NONE" NOT ALLOWED WITH "LINE PCC=TRAN"**

Explanation:    An invalid combination of parameters was specified.

System response:    The system continues processing.

User action:    Specify no code translation to be done, or reference a code translation table and recompile the JSL file.

**XPD0156W    JOB-ID = <JDE-NAME>:RRESUME AND RSUSPEND SHOULD BOTH BE SPECIFIED**

Explanation:    The RSUSPEND and RRESUME commands must be specified together.

System response:    The system continues processing.

User action:    Remove the command or add its companion command and recompile the JSL file.

**XPD0157W    JOB-ID = <JDE-NAME>:RSTACK ACCTLNFO OFFSET + LENGTH EXCEEDS RECORD LENGTH**

Explanation:    The RSTACK offset and length values must fall within the record length.

System response:    The system continues processing.

User action:    Correct the offset and length values or the record length value, depending on your needs and recompile the JSL file.

**XPD0158W      JOB-ID = <JDE-NAME>:OFFSET TO BLOCK SELECT FIELD + LENGTH EXCEEDS  
BLOCK LENGTH**

Explanation:      The BSELECT offset and length values must fall within the block length.  
System response:      The system continues processing.  
User action:      Correct the offset and length values or the block length value, depending  
on your needs and recompile the JSL file.

**XPD0159W      JOB-ID = <JDE-NAME>:OFFSET TO BLOCK DELETE FIELD + LENGTH EXCEEDS  
BLOCK LENGTH**

Explanation:      The BDELETE offset and length values must fall within the block length.  
System response:      The system continues processing.  
User action:      Correct the offset and length values or the block length value, depending  
on your needs and recompile the JSL file.

**XPD0160W      JOB-ID = <JDE-NAME>:OFFSET TO RECORD SELECT FIELD + LENGTH EXCEEDS  
-RECORD LENGTH**

Explanation:      The RSELECT offset and length values must fall within the record length.  
System response:      The system continues processing.  
User action:      Correct the offset and length values or the record length value, depending  
on your needs and recompile the JSL file.

**XPD0161W      JOB-ID = <JDE-NAME>:OFFSET TO RECORD DELETE FIELD + LENGTH EXCEEDS  
RECORD LENGTH**

Explanation:      The RDELETE offset and length values must fall within the record length.  
System response:      The system continues processing.  
User action:      Correct the offset and length values or the record length value, depending  
on your needs and recompile the JSL file.

**XPD0162W      JOB-ID = <JDE-NAME>:OFFSET TO RRESUME FIELD + LENGTH EXCEEDS RECORD  
LENGTH**

Explanation:      The RRESUME offset and length values must fall within the record length.  
System response:      The system continues processing.  
User action:      Correct the offset and length values or the record length value, depending  
on your needs and recompile the JSL file.

**XPD0163W    JOB-ID <JDE-NAME>:OFFSET TO RSUSPEND FIELD + LENGTH EXCEEDS RECORD LENGTH**

Explanation:    The RSUSPEND offset and length values must fall within the record length.

System response:    The system continues processing.

User action:    Correct the offset and length values or the record length value, depending on your needs and recompile the JSL file.

**XPD0164W    JOB-ID = <JDE-NAME>:OFFSET TO ROFFSET FIELD + LENGTH EXCEEDS RECORD LENGTH**

Explanation:    The ROFFSET offset and length values must fall within the record length.

System response:    The system continues processing.

User action:    Correct the offset and length values or the record length value, depending on your needs and recompile the JSL file.

**XPD0165W    JOB-ID = <JDE-NAME>:OFFSET TO RPAGE FIELD + LENGTH EXCEEDS RECORD LENGTH**

Explanation:    The RPACE offset and length values must fall within the record length.

System response:    The system continues processing.

User action:    Correct the offset and length values or the record length value, depending on your needs and recompile the JSL file.

**XPD0166W    JOB-ID = <JDE-NAME>:OFFSET TO RAUX FIELD + LENGTH EXCEEDS RECORD LENGTH**

Explanation:    The RAUX offset and length values must fall within the record length.

System response:    The system continues processing.

User action:    Correct the offset and length values or the record length value, depending on your needs and recompile the JSL file.

**XPD0167W    JOB-ID = <JDE-NAME>:OFFSET TO RSTACK FIELD + LENGTH EXCEEDS RECORD LENGTH**

Explanation:    The RSTACK offset and length values must fall within the record length.

System response:    The system continues processing.

User action:    Correct the offset and length values or the record length value, depending on your needs and recompile the JSL file.

**XPD0168W    CME POS VALUE SMALLER THEN PREVIOUS ONE -- IGNORED**

Explanation:    A CME POS option is specified in incorrect sequence.

System response:    The system continues processing.

User action:    Correct the options to run in ascending order and recompile the JSL file.

**XPD0169W CME LINE RANGE <VALUE> IS OUT OF RANGE**

Explanation: A CME LINE option is out of range.  
System response: The system continues processing.  
User action: Correct the option to fall within the range [1, 255] and recompile the JSL file.

**XPD0170W INCOMPLETE OR INVALID CME STATEMENT -- IGNORED**

Explanation: The CME command is missing the required parameter(s) or is in error.  
System response: The system continues processing.  
User action: Correct the CME command and recompile the JSL file.

**XPD0171E HEX OR OCTAL STRING HAS ODD NUMBER OF CHARACTERS**

Explanation: A hexadecimal or octal string was specified with an odd number of characters.  
System response: The system continues processing.  
User action: Correct the hexadecimal or octal string and recompile the JSL file.

**XPD0172E INVALID STRING**

Explanation: The string specified is invalid.  
System response: The system continues processing.  
User action: Refer to the PDL/DIDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0173E TEXT TYPE ERROR**

Explanation: The code representation type specified for the string option is invalid.  
System response: The system continues processing.  
User action: Refer to the PDL/DJDE Reference for your printer, for the supported code representation types and recompile the JSL file.

**XPD0174E OCT STRING CODE VALUE <VALUE> NOT IN RANGE [0,07777]**

Explanation: The octal string specified is out of range.  
System response: The system continues processing.  
User action: Correct the octal string to fit within the range [0, 07777] and recompile the JSL file.

**XPD0175E      HEX STRING CODE VALUE <VALUE> NOT IN RANGE [0,XFFFF]**

Explanation:      The hexadecimal string specified is out of range.  
System response:    The system continues processing.  
User action:        Correct the hexadecimal string to fit within the range [0, XFFFF] and recompile the JSL file.

**XPD0177E      REPEAT COUNT ERROR -- OUT OF RANGE, STR <VALUE>**

Explanation:      The repeat count specified for the option string is out of range.  
System response:    The system continues processing.  
User action:        Specify a repeat count within the range [0, 255] and recompile the JSL file.

**XPD0178E      MULTIPLE DECIMAL POINTS DETECTED**

Explanation:      Multiple decimal points were detected in the value specified.  
System response:    The system continues processing.  
User action:        Remove the redundant decimal point and recompile the JSL file.

**XPD0179E      TOO MANY DECIMAL PLACES -- TRUNCATED, STR = <VALUE>**

Explanation:      The option does not allow as many decimal places as specified.  
System response:    The system continues processing.  
User action:        Refer to the PDL/DIDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0180E      INVALID NUMERIC DIGIT DETECTED**

Explanation:      An invalid character was used in a numeric option.  
System response:    The system continues processing.  
User action:        Correct the value to use only digits in a numeric option and recompile the JSL file.

**XPD0181E      AMBIGUOUS ABBREVIATION. FULL KEYWORD EXPECTED, STR = <NAME>**

Explanation:      A keyword that cannot be abbreviated was used in an abbreviated form.  
System response:    The system continues processing.  
User action:        Specify the full keyword and recompile the JSL file.

**XPD0182W    UNCLOSED COMMENT DETECTED AT END OF FILE**

Explanation:    XPDL could not find the matching end-of-comment string (\*/) for the start-of-comment string it detected earlier in the JSL file.

System response:    The system continues processing.

User action:    Insert the end-of-comment string (\*/) at the appropriate location and recompile the JSL file.

**XPD0184W    LINE RANGE ERROR, CME FIELD IGNORED, STR = <LINE>**

Explanation:    A CME LINE option is specified in incorrect sequence or overlaps.

System response:    The system continues processing.

User action:    Correct the options to run in a non-overlapping and ascending order and recompile the JSL file.

**XPD0190I    \*\*\* INVALID OPTION, <OPTION> \*\*\***

Explanation:    XPDL encountered an invalid option.

System response:    The system continues processing.

User action:    Remove or correct the invalid option and recompile the JSL file.

**XPD0200W    MAP STATEMENT MUST BE SPECIFIED WITHIN JDL CONTEXT**

Explanation:    A SEFFNT MAP parameter was specified outside a job.

System response:    The system continues processing.

User action:    Refer to the PDL/DIDE Reference for your printer, for the correct usage of the MAP statement and recompile the JSL file.

**XPD0201W    SEFMAP AND MAP STATEMENTS CAN'T CO-EXIST**

Explanation:    Both SEFMAP and MAP parameters were specified in the same job.

System response:    The system continues processing.

User action:    Remove one of the parameters and recompile the JSL file.

**XPD0202W    FONT NOT UNIQUELY DEFINED**

Explanation:    A font was mapped to more than one substitute font.

System response:    The system continues processing.

User action:    Correct the font mappings so that each font is mapped to only one font and recompile the JSL file.

**XPD0203W    COMPILATION TERMINATED**

Explanation:    Compilation of the JSL was terminated due to an error.

The system stops processing.

User action:    Refer to previous error messages, correct the JDE and recompile the JSL file.

**XPD0204E    1ST CRITERIA TABLE MISSING**

Explanation:    Two criteria tables were referenced but the first one is missing.

System response:    The system continues processing.

User action:    Check for misspelling or add a criteria table with the same name as the missing one and recompile the JSL file.

**XPD0205E    INVALID OPTION POSITION OR TYPE, STR = <STRING>**

Explanation:    The specified option does not conform to the position or type required by the command parameter.

System response:    The system continues processing.

User action:    Refer to the PDL/DIDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0206E    NO VALID CLUSTER NAME OR REFERENCE WAS SPECIFIED**

Explanation:    An OSTK cluster name or reference is missing or incorrectly specified.

System response:    The system continues processing.

User action:    Refer to the PDL/DJDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0221E    INVALID PUNCTUATION, STR = <INKNAME>**

Explanation:    An inkname is specified incorrectly.

System response:    The system continues processing.

User action:    Refer to the PDL/DJDL Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0222E    INVALID INK REFERENCING SYNTAX STRUCTURE**

Explanation:    The syntax of an ink reference is incorrect.

System response:    The system continues processing.

User action:    Refer to the PDL/DJDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0223E REPEAT PARAMETER STATEMENT FOR NEW FORM NAME, STR = <FORM-NAME>**

Explanation: The parameter must be repeated for each new form.  
System response: The system continues processing.  
User action: Refer to the PDL/DJDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0224E TOO MANY OPTIONS. ALL INK REFERENCES IGNORED**

Explanation: Too many ink references were specified.  
System response: The system continues processing.  
User action: Refer to the PDL/DJDE Reference for your printer, for the correct syntax and recompile the JSL file.

**XPD0225E CATALOG NAME TOO LONG -- TRUNCATED, STR = <CATALOG-NAME>**

Explanation: The specified catalog name is too long and was truncated.  
System response: The system continues processing.  
User action: Correct the catalog name for a maximum of 6 characters and recompile the JSL file.

**XPD0226E PALETTE NAME TOO LONG -- TRUNCATED, STR = <PALETTE-NAME>**

Explanation: The specified palette name is too long and was truncated.  
System response: The system continues processing.  
User action: Correct the palette name for a maximum of 31 characters and recompile the JSL file.

**XPD0260W UNSUPPORTED FEATURE, STR = <FEATURE>**

Explanation: A parameter or option is not supported for the PDL version selected.  
System response: The system continues processing.  
User action: Remove the unsupported feature and recompile the JSL file.

**XPD0265E REQUIRED PARENTHESIS NOT FOUND**

Explanation: The required parenthesis is missing.  
System response: The system continues processing.  
User action: Insert the parenthesis and recompile the JSL file.

**XPD0266E      NEGATIVE VALUE NOT ALLOWED, STR = <NUMBER>**

Explanation:      A negative value is not allowed for this parameter.  
System response:      The system continues processing.  
User action:      Modify the value so that it becomes a positive number and recompile the JSL file.

**XPD0271F      TOF EXCEEDS BOF**

Explanation:      The value of TOF exceeds the value of BOF.  
System response:      The system continues processing.  
User action:      Reduce the value of TOF or increase the value of BOF so that TOF is smaller than or equal to BOF and recompile the JSL file.

**XPD4142W      XES INLINE FONT AREA EXCEEDED. INLINE FONT WILL BE IGNORED.**

Explanation:      An XES inline font was encountered that exceeded the allowable font size.  
System response:      The XES font is discarded. Processing continues.  
User action:      If this is an XES document, ensure that all fonts are separated by an <esc>+F or an <esc>+A, otherwise contact Xerox Technical Support.

**XPD4143E      XES INLINE FONT TABLE EXCEEDED. DOCUMENT WILL BE ABORTED.**

Explanation:      An XES inline resource was encountered that required more than 4MB of internal storage.  
System response:      The document is aborted.  
User action:      Contact Xerox Technical Support.

**XPD4144E      RESOURCE FRAGMENT DETECTED, BUT NO RESOURCE LOAD IN PROGRESS.**

Explanation:      An internal processing error has occurred.  
System response:      The document is aborted.  
User action:      Contact Xerox Technical Support.

**XPD4145E      MORE THAN 64 IMAGES ON A PAGE ARE NOT CURRENTLY SUPPORTED**

Explanation:      When converting a document to PDF a was encountered that contained more than 64 images.  
System response:      The 65th and subsequent images are dropped from the page.  
Contact Xerox Technical Support to request that the maximum number of images allowed on a page is increased.

## XPFE messages

---

There are two versions of XPFE messages: a short version that appears on line one of a panel and a long version that appears on line three. The long version appears only if you enter HELP or press PF1 when a short message is displayed. Both versions of the message are provided in this chapter.

**XPFE001E      DUPLICATE MEMBER  
DUPLICATE MEMBER NAME FOUND IN LIST. NAMES MUST BE UNIQUE.**

- Explanation: After adding a new line to the list of copy modifications or page layouts, you entered the name of an existing copy modification or page layout, then typed E to edit the duplicate entry.
- System response: The cursor is positioned in the 'OPTION' column. The duplicate entry cannot be edited.
- User action: Enter **D** to delete the duplicate entry, or overwrite the duplicate name with a unique name.

**XPFE002E      ONE COPY MOD REQUIRED  
AT LEAST ONE COPY MOD IS REQUIRED TO CREATE A PAGE FORMAT.**

- Explanation: You tried to delete the last copy modification from a page format.
- System response: The cursor is positioned in the 'OPTION' column. The copy modification is not deleted.
- User action: Leave at least one copy modification in the page format. If you no longer need the page format, delete it from the page format library.

**XPFE003E      ONE PAGE LAYOUT REQUIRED  
AT LEAST ONE PAGE LAYOUT IS REQUIRED TO CREATE A PAGE FORMAT.**

- Explanation: You tried to delete the last page layout from a page format.
- System response: The cursor is positioned in the 'OPTION' column. The page layout is not deleted.
- User action: Leave at least one page layout in the page format. If you no longer need the page format, delete it from the page format library.

**XPFE004E      INVALID PAGE LAYOUT NAME  
PAGE LAYOUT NAME CANNOT BE BLANK.**

- Explanation: After adding a new line to the list of page layouts, you typed E to edit the entry but left the 'PAGE LAYOUT NAME' column blank.
- System response: The cursor is positioned in the 'PAGE LAYOUT NAME' column. The blank entry cannot be edited.
- User action: Enter a unique name, or enter **D** in the 'OPTION' column to delete the blank entry.

**XPFE005E      DEFAULT VALUES DISPLAYED  
THESE VALUES CANNOT BE DELETED.**

Explanation: While editing line data specifications in a page layout, you tried to delete the last set of line parameters. You must have at least one set of parameters in each page layout.

System response: The cursor is positioned in the 'OPT' column. The line parameters are not deleted.

User action: Continue editing the page format.

**XPFE006E      MEMBER NOT FOUND  
*page format* NOT IN *library*.**

Explanation: While attempting to generate (compile) the named page format, the page format editor was not able to find a list of page layouts in the FLIST library for this page format.

System response: The page format is not generated.

User action: Verify that you used the correct dataset name prefix and page format name. Edit the page format and verify that you defined at least one valid copy modification and page layout. Regenerate the page format.

**XPFE010E      NO OPTION SELECTED  
ENTER ONE OF THE OPTIONS LISTED ON THIS PANEL.**

Explanation: While editing a copy modification or page layout, you either entered an invalid option or left the 'OPTION' column blank.

System response: The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.

User action: Enter one of the options displayed on the panel.

**XPFE011I      UPDATE SUCCESSFUL  
THE CHANGES HAVE BEEN INCORPORATED SUCCESSFULLY.**

Explanation: The changes you made to the copy modification or page layout were incorporated successfully.

System response: Processing continues.

User action: None required.

**XPFE012I      PREFIX *prefix name*  
*prefix name* IS THE ACTIVE PREFIX FOR THIS EDITING SESSION.**

Explanation: *Prefix name* is the dataset name prefix allocated for this editing session. This message is displayed each time you access the Maintain Page Formats panel.

System response: Processing continues.

User action: None required.

**XPFE013E      GENERATE PROCESS FAILED  
ILAND ORIENTATION REQUIRES A FONT. THERE IS NO DEFAULT.**

Explanation:      While editing a page layout, you selected an inverse landscape orientation for the page layout, but did not specify a font. There is no default font for inverse landscape orientations.

System response:      The page format is not generated.

User action:      In the line data specifications or field format for the page layout, enter the name of an inverse landscape font.

**XPFE014E      INVALID ORIENTATION  
ENTER ONE OF THESE VALUES: PORT, LAND, IPORT, OR ILAND.**

Explanation:      While editing a page layout, you entered an invalid value in the 'ORIENTATION' column, then typed E to edit the page layout.

System response:      The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.

User action:      Enter one of these values:

**PORT  
LAND  
IPORT  
ILAND**

**XPFE016E      GENERATE PROCESS FAILED  
NO VALID PRINT DIRECTION WAS FOUND.**

Explanation:      This is an internal processing error.

System response:      The page format is not generated.

User action:      Call Xerox Technical Support.

**XPFE018E      INVALID FIELD  
ENTER A NUMERIC VALUE IN THE INDICATED FIELD.**

Explanation:      While setting configuration options, you either entered a nonnumeric value or left the indicated field blank.

System response:      The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.

User action:      Enter a numeric value.

**XPFE019E      INVALID NAME  
THIS NAME CAN CONTAIN ONLY ALPHANUMERIC CHARACTERS AND @, #, OR \$.**

Explanation:      You entered an invalid name in the indicated field.

System response:      The cursor is positioned on the name in error. No further processing is permitted until the error is corrected.

User action:      Correct the name. Valid names can include alphanumeric characters and @, #, or \$.

**XPFE020E      INVALID COUNT**  
**THIS VALUE MUST NOT BE BLANK. ENTER A WHOLE NUMBER.**

- Explanation: While editing line data specifications in a page layout, you entered an invalid value in the 'COUNT' column.
- System response: The cursor is positioned in the 'COUNT' column. No further processing is permitted until the error is corrected.
- User action: Enter an integer value. Do not enter a decimal value or leave this field blank.

**XPFE021E      INVALID POSITION ACROSS**  
*line* **POSITION ACROSS MUST BE A NUMERIC ENTRY OR** *margin.*

- Explanation: While editing line data specifications in a page layout, you entered an invalid value in the 'POSITION ACROSS' column.
- System response: The cursor is positioned in the 'POSITION ACROSS' column. No further processing is permitted until the error is corrected.
- User action: Enter a numeric value or **MARGIN**.

**XPFE022E      INVALID POSITION DOWN**  
*line* **POSITION DOWN MUST BE A NUMERIC ENTRY, TOP, OR NEXT.**

- Explanation: While editing line data specifications in a page layout, you entered an invalid value in the 'POSITION DOWN' column.
- System response: The cursor is positioned in the 'POSITION DOWN' column. No further processing is permitted until the error is corrected.
- User action: Enter a numeric value, **TOP**, or **NEXT**.

**XPFE023E      INVALID FIELD**  
**THE INDICATED FIELD MUST CONTAIN A VALID DECIMAL NUMBER.**

- Explanation: While editing a page layout, you entered an invalid value in the indicated field.
- System response: The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.
- User action: Enter a decimal number within the range permitted for this field.

**XPFE024E      INVALID PAGE FORMAT NAME**  
**THE PAGE FORMAT NAME MUST BE A VALID IBM DATASET MEMBER NAME.**

- Explanation: On the Maintain Page Formats panel, you entered an invalid name in the 'Page Format Name' field.
- System response: The cursor is positioned on the 'Page Format Name' field. No further processing is permitted until the error is corrected.
- User action: Enter a valid IBM dataset member name up to eight characters in length. This name must begin with an alphabetic character (A-Z), @, #, or \$. The remaining characters can be alphanumeric, @, #, or \$.

**XPFE025E      INVALID FIELD FORMAT  
THE FIELD FORMAT NAME MUST BE A VALID IBM DATASET MEMBER NAME.**

- Explanation: While editing line data specifications in a page layout, you entered an invalid name in the 'FIELD FORMAT' column.
- System response: The cursor is positioned in the 'FIELD FORMAT' column. No further processing is permitted until the error is corrected.
- User action: Enter a valid IBM dataset member name up to eight characters in length. This name must begin with an alphabetic character (A-Z), @, #, or \$. The remaining characters can be alphanumeric, @, #, or \$.

**XPFE026E      INVALID CHANNEL  
ENTER A NUMBER BETWEEN 1 AND 12.**

- Explanation: While editing line data specifications in a page layout, you entered an invalid value in the 'CHAN' column.
- System response: The cursor is positioned in the 'CHAN' column. No further processing is permitted until the error is corrected.
- User action: Enter an integer value between 1 and 12.

**XPFE027E      INVALID UNITS  
ENTER ONE OF THESE VALUES: IN, CM, MM, OR DOT.**

- Explanation: While editing a copy modification or global specifications in a page layout, you entered an invalid value in the 'Unit Measure' field.
- System response: The cursor is positioned on the 'Unit Measure' field. No further processing is permitted until the error is corrected.
- User action: Enter **IN**, **CM**, **MM**, or **DOT**.

**XPFE028E      INVALID FIELD FORMAT  
WHEN USING OPTION E, THIS FIELD MUST CONTAIN A FIELD FORMAT.**

- Explanation: While editing line data specifications in a page layout, you entered E in the 'OPT' column but did not specify a field format name.
- System response: The cursor is positioned in the 'FIELD FORMAT' column. No further processing is permitted until the error is corrected.
- User action: If you want to edit a field format, enter a name in the 'FIELD FORMAT' column and **E** in the 'OPT' column. Otherwise, enter a different value in the 'OPT' column.

**XPFE030E      DATASET NOT FOUND  
dataset name **COULD NOT BE FOUND.****

- Explanation: While attempting to generate a page format, the page format editor was unable to find the named dataset.
- System response: The page format is not generated.
- User action: Verify that you entered the name of the PDS that has been allocated to store the generated page format. If the name is invalid, correct it. If the name is valid, reenter it and try again.

- XPFE031I**     *page format name* **GENERATED**  
*page format name* **PAGE FORMAT GENERATED IN LIBRARY** *library name*.
- Explanation:     The named page format was generated successfully and stored in the named library.
- System response:     Processing continues.
- User action:     None required.
- 
- XPFE032E**     **INVALID COND**  
**ENTER YES OR NO.**
- Explanation:     While editing line specifications in a page layout, you entered an invalid value in the 'COND' column or left the column blank.
- System response:     The cursor is positioned in the 'COND' column. No further processing is permitted until the error is corrected.
- User action:     Enter **YES** if conditional formatting is active for this line group. Enter **NO** if conditional formatting is not active.
- 
- XPFE033E**     **INVALID** *name*  
**CONDITION ID NAME MUST FOLLOW STANDARD IBM NAMING CONVENTIONS.**
- Explanation:     While editing conditional formatting parameters in a page layout, you entered an invalid name in the 'CONDITION ID' column.
- System response:     The cursor is positioned in the 'CONDITION ID' column. No further processing is permitted until the error is corrected.
- User action:     Correct the name. This name may be up to eight characters in length, and must begin with an alphabetic character (A-Z), @, #, or \$. The remaining characters can be alphanumeric, @, #, \$.
- 
- XPFE034E**     **INVALID COPIES**  
**ENTER A NUMBER BETWEEN 1 AND 255.**
- Explanation:     While editing a copy modification, you entered an invalid value in the 'Number of Copies' field.
- System response:     The cursor is positioned on the 'Number of Copies' field. No further processing is permitted until the error is corrected.
- User action:     Enter an integer value between 1 and 255.
- 
- XPFE036I**     **NO MEMBERS FOUND**  
**VERIFY THAT THE PATTERN IS VALID AND THAT THE LIBRARY IS NOT EMPTY.**
- Explanation:     No members were found in the page format library that match the pattern of characters you entered.
- System response:     The cursor is positioned on the OPTION line. No further processing is permitted until the error is corrected.
- User action:     Examine the character pattern you entered. If it is incorrect, change it. If it is correct, the library may be empty.

- XPFE037E UNEXPECTED ERROR**  
**AN UNEXPECTED ERROR OCCURRED DURING MEMBER FIND. RC=***return code*.
- Explanation: An unexpected error occurred while trying to find a member. This message is generated by ISPF.
- System response: Processing is terminated.
- User action: Examine the member name to determine whether it is valid. Examine the appropriate library to determine whether it is corrupt.
- 
- XPFE038I NO MEMBERS SELECTED**  
**NO MEMBERS WERE SELECTED FOR PROCESSING.**
- Explanation: You entered the END command (PF3) on the member selection list without selecting a member.
- System response: The system returns to the previous panel.
- User action: None required.
- 
- XPFE039E INVALID COMMAND**  
*command* **IS NOT A VALID MEMBER SELECTION COMMAND.**
- Explanation: The command you entered on the member selection panel is invalid.
- System response: The cursor is positioned on the invalid command. No further processing is permitted until the error is corrected.
- User action: Enter **S** to select a member.
- 
- XPFE040E INVALID ORIGIN ACROSS**  
**ENTER A VALID DECIMAL NUMBER.**
- Explanation: While editing a copy modification, you entered a nonnumeric value in the 'Page Origin Across' field.
- System response: The cursor is positioned on the 'Page Origin Across' field. No further processing is permitted until the error is corrected.
- User action: Enter a decimal value within the valid range for this field.
- 
- XPFE041E INVALID ORIGIN DOWN**  
**ENTER A VALID DECIMAL NUMBER.**
- Explanation: While editing a copy modification, you entered a nonnumeric value in the 'Page Origin Down' field.
- System response: The cursor is positioned on the 'Page Origin Down' field. No further processing is permitted until the error is corrected.
- User action: Enter a decimal value within the valid range for this field.

**XPFE042E      INVALID REPORT STACKING  
ENTER YES OR NO.**

- Explanation: While editing a copy modification, you entered an invalid value in the 'Report Stacking' field.
- System response: The cursor is positioned on the 'Report Stacking' field. No further processing is permitted until the error is corrected.
- User action: Enter **YES** if you want the output for this set of copies to be offset from the preceding set. Enter **NO** if you do not want the output for this set of copies to be offset from the preceding set.

**XPFE043E      INVALID TRAY NUMBER.  
ENTER A NUMBER FROM 1 TO 9.**

- Explanation: While editing a copy modification, an invalid value was specified for the 'Tray Number' field.
- System response: The panel is redisplayed so that a valid value may be entered. No further processing is permitted until the error is corrected.
- User action: Enter a whole number value from 1 to 9.

**XPFE044E      INVALID DUPLEX MODE  
ENTER YES OR NO.**

- Explanation: While editing a copy modification, you entered an invalid value in the 'Duplex Mode' field.
- System response: The cursor is positioned on the 'Duplex Mode' field. No further processing is permitted until the error is corrected.
- User action: Enter **YES** to print in duplex mode. Enter **NO** to print in simplex mode.

**XPFE045E      GENERATE PROCESS FAILED  
THE LINE POSITION IS OUTSIDE THE DEFINED LOGICAL PAGE.**

- Explanation: While attempting to generate (compile) a page format, the page format editor encountered a line in a page layout that is positioned outside the logical page.
- System response: The page format is not generated.
- User action: Either change the logical page dimensions in the page layout global specifications to accommodate the line or reposition the line in the line data specifications. Regenerate the page format.

**XPFE046E**     *resource* **WRITE ERROR**  
**AN ERROR OCCURRED WRITING** *resource*. **CHECK** *name dataset*.

Explanation:     An error occurred while trying to store the named resource in the identified dataset. The dataset may not have any available directory space.

System response:     The requested function is not performed.

User action:     Do not cancel from the panel or your newly entered information will be lost. Instead, swap out of the XOAF session and delete or copy some members from the named dataset, compress the dataset, and swap back into the page format editor. Press **PF3** to save your changes.

**XPFE047E**     **INVALID PAGE WIDTH**  
**ENTER A VALID DECIMAL NUMBER.**

Explanation:     While editing global specifications in a page layout, you entered a nonnumeric value in the 'Width' field.

System response:     The cursor is positioned on the 'Width' field. No further processing is permitted until the error is corrected.

User action:     Enter a decimal value within the valid range for this field.

**XPFE048E**     **INVALID PAGE HEIGHT**  
**ENTER A VALID DECIMAL NUMBER.**

Explanation:     While editing global specifications in a page layout, you entered a nonnumeric value in the 'Height' field.

System response:     The cursor is positioned on the 'Height' field. No further processing is permitted until the error is corrected.

User action:     Enter a decimal value within the valid range for this field.

**XPFE049E**     **INVALID MARGIN**  
**ENTER A VALID DECIMAL NUMBER.**

Explanation:     While editing global specifications in a page layout, you entered a nonnumeric value in the 'Margin' field.

System response:     The cursor is positioned on the 'Margin' field. No further processing is permitted until the error is corrected.

User action:     Enter a decimal value within the valid range for this field.

**XPFE050E**     **INVALID B/A**  
**ENTER "B" FOR BEFORE OR "A" FOR AFTER.**

Explanation:     While editing a condition ID in a page layout, you entered an invalid value in the 'B/A' column.

System response:     The cursor is positioned in the 'B/A' column. No further processing is permitted until the error is corrected.

User action:     Enter **B** if the action resulting from the condition test should take place before the line or line group. Enter **A** if the action should take place after the line or line group.

**XPFE051E      INVALID L/G  
ENTER "L" FOR LINE OR "G" FOR LINE GROUP.**

- Explanation: While editing a condition ID in a page layout, you entered an invalid value in the 'L/G' column.
- System response: The cursor is positioned on the 'L/G' column. No further processing is permitted until the error is corrected.
- User action: Enter **L** if processing should occur before or after the current line. Enter **G** if processing should occur before or after the line group identified by the 'END GROUP' column.

**XPFE052E      INVALID COLOR  
ENTER ONE OF THESE VALUES: DEF,BLU,RED,PNK,GRN,TRQ,YLW,BLK,BRW.**

- Explanation: While editing line data specifications or a field format in a page layout, you entered an invalid color.
- System response: The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.
- User action: Enter one of these values:
- |            |             |
|------------|-------------|
| <b>DEF</b> | (default)   |
| <b>BLU</b> | (blue)      |
| <b>RED</b> |             |
| <b>PNK</b> | (pink)      |
| <b>GRN</b> | (green)     |
| <b>TRQ</b> | (turquoise) |
| <b>YLW</b> | (yellow)    |
| <b>BLK</b> | (black)     |
| <b>BRW</b> | (brown)     |

**XPFE053E      INVALID CONSTANT  
ENTER YES OR NO.**

- Explanation: While editing a field format in a page layout, you entered an invalid value in the 'CONSTANT' column.
- System response: The cursor is positioned in the 'CONSTANT' column. No further processing is permitted until the error is corrected.
- User action: Enter **YES** if the field is associated with a constant string. Enter **NO** if the field is associated with a field in an input data stream.

**XPFE054E      INVALID INPUT START  
ENTER A VALID INTEGER.**

- Explanation: While editing a field format in a page layout, you entered a decimal or alphabetic value in the 'INPUT START' column.
- System response: The cursor is positioned in the 'INPUT START' column. No further processing is permitted until the error is corrected.
- User action: Enter the field's starting column in the input data stream as an integer value. Do not include any spaces or alphabetic characters.

**XPFE055E      INVALID INPUT LENGTH  
ENTER A VALID INTEGER.**

- Explanation: While editing a field format in a page layout, you entered a non-integer or alphanumeric value in the 'INPUT LENGTH' column.
- System response: The cursor is positioned in the 'INPUT LENGTH' column. No further processing is permitted until the error is corrected.
- User action: Enter the field's length in the input data stream as an integer value. Do not include any spaces or alphabetic characters.

**XPFE056E      *page layout name* MUST BE EDITED  
*page layout name* MUST BE EDITED BEFORE YOU CAN SAVE THE MEMBER.**

- Explanation: The page layout you have added to the page format must be edited before you can save the page format.
- System response: The cursor is positioned in the 'OPTION' column. No further processing is permitted until the error is corrected.
- User action: Enter **E** in the 'OPTION' column and edit the page layout.

**XPFE057E      *field format name* MUST BE EDITED  
*field format name* MUST BE EDITED BEFORE YOU CAN SAVE THE MEMBER.**

- Explanation: The field format you have added to the page format must be edited before you can save the page format.
- System response: The cursor is positioned in the 'OPT' column. No further processing is permitted until the error is corrected.
- User action: Enter **E** in the 'OPT' column for the line group to which you have added a field format and edit the field format.

**XPFE058E      *copy modification name* MUST BE EDITED  
*copy modification name* MUST BE EDITED BEFORE YOU CAN SAVE THE MEMBER.**

- Explanation: The copy modification you have added to the page format must be edited before you can save the page format.
- System response: The cursor is positioned in the 'OPTION' column. No further processing is permitted until the error is corrected.
- User action: Enter **E** in the 'OPTION' column and edit the copy modification.

**XPFE059E      INVALID CLUSTER NAME  
ENTER UP TO 6 ALPHANUMERIC CHARACTERS (1ST MUST BE ALPHABETIC).**

- Explanation: While editing a copy modification, you entered an invalid cluster name.
- System response: The cursor is positioned on the 'Cluster Name' field. No further processing is permitted until the error is corrected.
- User action: Enter a 1- to 6-character cluster name that begins with an alphabetic character.

**XPFE060E      INVALID FONT INDEX  
ENTER A UNIQUE NUMBER BETWEEN 0 AND 126.**

- Explanation: While editing a font list in a page layout, you entered an invalid value in the 'FONT INDEX' column.
- System response: The cursor is positioned in the 'FONT INDEX' column. No further processing is permitted until the error is corrected.
- User action: Enter a value between 0 and 126. Do not enter the same value more than once in the list.

**XPFE061E      INVALID *field name*  
ENTER YES OR NO.**

- Explanation: Your entry in the identified field was something other than YES or NO.
- System response: The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.
- User action: Enter **YES** or **NO** only.

**XPFE062E      MISSING FONT ID  
ENTER THE NAME OF A XEROX FONT OR DELETE THIS LINE BEFORE SAVING.**

- Explanation: While editing a font list in a page layout, you attempted to exit the panel without entering a font name in the 'FONT' column.
- System response: The cursor is positioned in the 'FONT' column. No further processing is permitted until the error is corrected.
- User action: Enter a font name in the 'FONT' column, or delete the line from the table.

**XPFE063E      GENERATE PROCESS FAILED  
UNABLE TO READ FLIST LIBRARY.**

- Explanation: While attempting to generate (compile) a page format, the page format editor was unable to read the FLIST library.
- System response: The page format is not generated.
- User action: Verify that the FLIST library has not been deleted or renamed. Ensure that the library is not corrupted. If the problem persists, call Xerox Technical Support.

**XPFE064E      GENERATE PROCESS FAILED  
UNABLE TO READ CPMOD LIBRARY.**

- Explanation: While attempting to generate (compile) a page format, the page format editor was unable to read the CPMOD library.
- System response: The page format is not generated.
- User action: Verify that the CPMOD library has not been deleted or renamed. Ensure that the library is not corrupted. If the problem persists, call Xerox Technical Support.

**XPFE065E      GENERATE PROCESS FAILED  
FIELD DEFINITION NOT FOUND IN FIELDD LIBRARY.**

Explanation: While attempting to generate (compile) a page format, the page format editor was unable to locate one of the field definitions in the FIELDD library.

System response: The page format is not generated.

User action: Examine the page format to make sure the field definition names are valid. If the field definition has been deleted from the FIELDD library, delete the name from the page format. If a field definition has been inadvertently deleted from the FIELDD library, recreate it, then regenerate the page format.

**XPFE066E      GENERATE PROCESS FAILED  
A COPY MOD SPECIFIED IN THE PAGE FORMAT WAS NOT FOUND.**

Explanation: While attempting to generate (compile) a page format, the page format editor was unable to locate one of the named copy modifications in the CPMOD library.

System response: The page format is not generated.

User action: Examine the page format to make sure the copy modification names are valid. If the copy modification has been deleted from the CPMOD library, delete the name from the page format. If a copy modification has been inadvertently deleted from the CPMOD library, recreate it, then regenerate the page format.

**XPFE067E      *condition id* NOT DEFINED  
*condition id* MUST BE EDITED BEFORE YOU CAN EXIT THIS TABLE.**

Explanation: While editing conditional formatting parameters in a page layout, you added a condition ID to the list, then attempted to exit the panel without editing the condition ID.

System response: The cursor is positioned in the 'OPT' column. No further processing is permitted until the error is corrected.

User action: Enter **E** in the 'OPT' column and define the conditional formatting parameters for this condition ID.

**XPFE068E      INVALID COND  
THIS VALUE MUST NOT BE BLANK. ENTER YES OR NO.**

Explanation: While editing line specifications in a page layout, you entered an invalid value in the 'COND' column or left the column blank.

System response: The cursor is positioned in the 'COND' column. No further processing is permitted until the error is corrected.

User action: Enter **YES** if conditional formatting is active for this line group. Enter **NO** if conditional formatting is not active.

**XPFE069E      INVALID TYPE  
ENTER ONE OF THESE VALUES: EQ, NE, LT, LE, GT, GE, CH, OT.**

- Explanation: While editing conditional formatting parameters in a page layout, you entered an invalid value in the 'TYPE' column.
- System response: The cursor is positioned in the 'TYPE' column. No further processing is permitted until the error is corrected.
- User action: Enter a valid type of comparison to be performed. Enter one of these values:

**EQ  
NE  
LT  
LE  
GT  
GE  
CH  
OT**

**XPFE070E      INVALID COPY MOD NAME  
ENTER A VALID NAME, CURRENT, NULL, =, OR /.**

- Explanation: While editing conditional formatting parameters in a page layout, you entered an invalid value in the 'COPY MODIFICATION NAME' column.
- System response: The cursor is positioned at the COMMAND line. No further processing is permitted until the error is corrected.
- User action: Enter a valid copy modification name, **CURRENT**, **NULL**, **=**, or **/**.

**XPFE071E      INVALID PAGE LAYOUT  
ENTER A VALID NAME, CURRENT, NULL, =, OR /.**

- Explanation: While editing conditional formatting parameters in a page layout, you entered an invalid value in the 'PAGE LAYOUT NAME' column.
- System response: The cursor is positioned at the COMMAND line. No further processing is permitted until the error is corrected.
- User action: Enter a valid page layout name, **CURRENT**, **NULL**, **=**, or **/**.

**XPFE072E      INVALID STRING LENGTH  
HEX CONSTANT STRINGS MUST CONTAIN AN EVEN NUMBER OF DIGITS.**

- Explanation: While editing a constant string for a field format, you entered an odd number of characters in the string. Because each EBCDIC character is composed of two hexadecimal digits, you must enter an even number of characters in this field if your string is hexadecimal.
- System response: The cursor is positioned on the 'String' field. No further processing is permitted until the error is corrected.
- User action: Ensure your entry has an even number of characters.

**XPFE073E    INVALID BLANKS IN STRING  
EMBEDDED BLANKS ARE NOT ALLOWED IN A HEX CONSTANT STRINGS.**

Explanation:    While editing a constant string for a field format, you entered a hexadecimal constant string containing embedded blanks. Embedded blanks are invalid for hexadecimal constant strings.

System response:    The cursor is positioned on the 'String' field. No further processing is permitted until the error is corrected.

User action:    Delete the embedded blanks.

**XPFE074E    INVALID CHAR IN STRING  
HEX CONSTANT STRINGS CAN CONTAIN THESE CHARACTERS: 0-9 AND A-F.**

Explanation:    While editing a constant string for a field format, you entered an invalid character in the string. In hexadecimal constant strings, you can use only the digits 0 through 9 and the characters A through F.

System response:    The cursor is positioned on the 'String' field. No further processing is permitted until the error is corrected.

User action:    Delete the invalid characters.

**XPFE075E    INVALID HEX VALUE  
HEX 00 IS NOT ALLOWED IN A CONSTANT STRING.**

Explanation:    While editing a constant string for a field format, you entered 00 in a hexadecimal character string. This is an invalid character combination.

System response:    The cursor is positioned on the 'String' field. No further processing is permitted until the error is corrected.

User action:    Delete the character combination 00.

**XPFE076E    INVALID STRING TYPE  
ENTER "C" FOR CHARACTER OR "X" FOR HEXADECIMAL CHARACTER.**

Explanation:    While editing a constant string for a field format, you entered an invalid string type.

System response:    The cursor is positioned on the 'Type' field. No further processing is permitted until the error is corrected.

User action:    Enter **C** (character) or **X** (hexadecimal).

**XPFE077E    GENERATE PROCESS FAILED  
UNABLE TO OPEN OR READ COND LIBRARY.**

Explanation:    While attempting to generate (compile) a page format, the page format editor was unable to open or read a condition ID member in the COND library.

System response:    The page format is not generated.

User action:    Verify that the condition IDs are valid. If a condition ID has been deleted from the COND library, you must enter a different condition ID in the page format. If a condition ID has been inadvertently deleted from the COND library, recreate it, then regenerate the page format.

**XPFE078E      GENERATE PROCESS FAILED  
UNABLE TO OPEN OR READ PLIST LIBRARY.**

Explanation:      While attempting to generate (compile) a page format, the page format editor was unable to open or read a member in the PLIST library.

System response:      The page format is not generated.

User action:      Verify that the PLIST library has not been deleted or renamed. Ensure that the library is not corrupted. If the problem persists, call Xerox Technical Support.

**XPFE079E      GENERATE PROCESS FAILED  
UNABLE TO OPEN OR READ LINED LIBRARY.**

Explanation:      While attempting to generate (compile) a page format, the page format editor was unable to open or read a member in the LINED library.

System response:      The page format is not generated.

User action:      Verify that the LINED library has not been deleted or renamed. Ensure that the library is not corrupted. If the problem persists, call Xerox Technical Support.

**XPFE080E      FIELD WRITE ERROR  
UNABLE TO WRITE FIELD MEMBER TO FIELDD LIBRARY.**

Explanation:      The page format editor encountered an error while trying to store a field format in the FIELDD library. The library may not have any available directory space.

System response:      The requested function cannot be completed.

User action:      Do not cancel from the panel or your newly entered information will be lost. Instead swap out of the XOAF session and delete or copy some members from the named dataset, compress the dataset, and swap back into the page format editor. Press **PF3** to save your changes.

**XPFE081E      TOO MANY CONSTANTS  
THE COMBINED LENGTH OF ALL CONSTANT STRINGS CANNOT EXCEED 8100.**

Explanation:      A single page layout cannot contain more than 8100 characters of constant text. Only the constant text entered within field formats is counted against this total. The comparison text within conditional formatting parameters is not counted against this total.

System response:      The page format is not generated.

User action:      Reduce the amount of constant text within your page layouts and regenerate the page format.

**XPFE083E      INVALID TRAY NUMBER  
ENTER A WHOLE NUMBER FROM 1 TO 9.**

Explanation:      While editing a copy modification, you entered an invalid value in the 'Tray Number' field.

System response:      The cursor is positioned on the 'Tray Number' field. No further processing is permitted until the error is corrected.

User action:      Enter a value from 1 to 9.

**XPFE085E      CONFIGURATION REQUIRED  
RUN INITIAL CONFIGURATION TO ALLOCATE REQUIRED DATASETS.**

Explanation:      You tried to select option 2, Maintain Page Formats, without first setting up your configuration.

System response:      The cursor is positioned on the OPTION line. No further processing is permitted until the error is corrected.

User action:      Select option 1, Allocate Page Format Datasets, to allocate the required datasets.

**XPFE086E      INVALID SELECTION  
YOU MUST SELECT FROM THE AVAILABLE OPTIONS.**

Explanation:      The option you selected is invalid for this menu.

System response:      The cursor is positioned on the OPTION line. No further processing is permitted until the error is corrected.

User action:      Select one of the available menu options.

**XPFE087E      INVALID CONSTANT  
CONSTANT FIELD VALUE MUST BE YES FOR EDIT OPTION.**

Explanation:      While editing a field format in a page layout, you entered E in the 'OPTION' column, but NO in the 'CONSTANT' column.

System response:      The cursor is positioned in the 'CONSTANT' column. No further processing is permitted until the error is corrected.

User action:      To edit a constant string, you must enter **E** in the 'OPTION' column and **YES** in the 'CONSTANT' column.

**XPFE088E      INVALID OUTPUT DATASET  
OUTPUT DATASET ORGANIZATION MUST BE PO.**

Explanation:      The page format dataset you specified to receive the generated page format is not a PDS.

System response:      The page format is not generated.

User action:      Allocate a PDS to be used as your page format library. The PDS must have a dataset organization of PO.

**XPFE089E      INVALID OUTPUT DATASET  
OUTPUT DATASET MUST BE LRECL 8205.**

Explanation:      The attributes of the page format dataset you specified to receive the generated page format are invalid.

System response:      The page format is not generated.

User action:      Delete the invalid dataset. Allocate a new PDS to be used as your page format library. The PDS must have a logical record length of 8205.

**XPFE090E      INVALID DIRECTION  
ENTER ONE OF THESE VALUES: A, D, B, OR U.**

Explanation:      While editing a field format in a page layout, you entered an invalid print direction for this field relative to the upper left corner of the logical page.

System response:      The cursor is positioned in the 'PRINT DIR' column. No further processing is permitted until the error is corrected.

User action:      Enter one of these values:

**A**    (across)  
**D**    (down)  
**B**    (back)  
**U**    (up)

**XPFE091E      INVALID DSNAME PREFIX  
ENTER ALL HIGH-LEVEL QUALIFIERS WITHOUT QUOTES.**

Explanation:      The dataset name you entered is invalid. You must enter a fully-qualified dataset name prefix without any quotes. The system does not add your user ID to the dataset name.

System response:      The datasets are not allocated.

User action:      Correct the dataset name prefix, specifying a high-level qualifier and any mid-level qualifiers you need. Do not enter quotes.

**XPFE092E      CANNOT ALLOCATE DSNAME  
CANNOT ALLOCATE *dataset name*.**

Explanation:      The page format editor could not allocate the datasets with the prefix you specified. This message is accompanied by system messages which provide additional information. This situation can occur for many reasons, such as the user not being authorized for the datasets identified by the prefix, insufficient space, or trying to compile a page format to the dataset while another user is browsing the dataset.

System response:      The datasets are not allocated.

User action:      Enter a different dataset prefix and try again.

**XPFE093E      INVALID COPY MOD  
COPY MOD NAME CANNOT BE BLANK.**

- Explanation:      You added a new line to the list of copy modifications, but left the 'COPY MODIFICATION NAME' column blank.
- System response:      The cursor is positioned in the 'OPTION' column. No further processing is permitted until the error is corrected.
- User action:      Enter a unique name in the 'COPY MODIFICATION NAME' column, or delete the blank line.

**XPFE094E      FIELD MUST BE BLANK  
START AND LENGTH FIELDS MUST BE BLANK FOR CONSTANT OPTION.**

- Explanation:      While editing a field format in a page layout, you entered a start and/or length value for a field that is specified as a constant string. If you are setting up a field as a constant string, you must leave the 'INPUT START' and 'INPUT LENGTH' columns blank.
- System response:      The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.
- User action:      Delete the entries from the 'INPUT START' and 'INPUT LENGTH' columns.

**XPFE095E      FIELD MUST BE BLANK  
WHEN DUPLEX IS NO, A FORM CANNOT BE SPECIFIED FOR BACK PAGE.**

- Explanation:      While editing a copy modification, you entered NO in the 'Duplex Mode' field and entered a form name in the 'Form Name for Back' field. If you are printing simplex, you must leave the 'Form Name for Back' field blank.
- System response:      The cursor is positioned on the 'Form Name for Back' field. No further processing is permitted until the error is corrected.
- User action:      If you want to print duplex, change the value of the 'Duplex Mode' field to **YES**. If you want to print simplex, delete the entry in the 'Form Name for Back' field.

**XPFE096E      *field* MUST BE POSITIVE  
A NEGATIVE *field* VALUE IS INVALID.**

- Explanation:      You entered a negative value in one of these fields: 'Width', 'Height', 'Margin', or 'LPI'. The value in these fields must be positive.
- System response:      The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.
- User action:      Enter a positive value in the identified field.

**XPFE097E      DUPLICATE FONT INDEX  
FONT INDEX #*index number* DUPLICATED IN LIST. NUMBERS MUST BE UNIQUE.**

Explanation: While editing a font list, you entered a font index value that is already present in the list. Font index values must be unique.

System response: The cursor is positioned on the 'OPTION' column. No further processing is permitted until the error is corrected.

User action: Enter a unique value between 0 and 126, or delete the duplicate line from the list.

**XPFE098E      UNKNOWN COMMAND  
THE VALUE ON THE COMMAND LINE IS NOT KNOWN TO THIS EDITOR.**

Explanation: The value you entered on the COMMAND line is not supported by the page format editor.

System response: The requested function is not performed.

User action: Enter a valid value on the COMMAND line.

**XPFE099E      GENERATE PROCESS FAILED  
FIELD POSITION IS OUTSIDE THE DEFINED PAGE.**

Explanation: While attempting to generate (compile) a page format, the page format editor encountered a field in a field format that is positioned outside the logical page.

System response: The page format is not generated.

User action: Either change the logical page dimensions in the page layout global specifications to accommodate the field, or reposition the field in the field format. Regenerate the page format.

**XPFE100E      MAX 25 MEMBERS EXCEEDED  
THE MAXIMUM NUMBER OF 25 CONDITIONAL MEMBERS HAS BEEN EXCEEDED.**

Explanation: You tried to create more than 25 separate conditional checks for one circumstance.

System response: Member creation stops after the 25th circumstance.

User action: Reduce the number of conditional members, or create a new line group (which allows 25 more members).

**XPFE101I      MEMBER COPIED  
THE REQUESTED MEMBER WAS COPIED.**

Explanation: The member you requested has been copied to the output dataset you named.

System response: Processing continues.

User action: None required.

**XPFE102E      DATASET NOT FOUND  
THE INPUT DATASET WAS NOT FOUND.**

Explanation:    The page format editor could not locate the input dataset you specified.  
System response:    The member you specified was not copied.  
User action:    Enter a valid input dataset name and try again.

**XPFE103E      DATASET NOT FOUND  
THE OUTPUT DATASET WAS NOT FOUND.**

Explanation:    The page format editor could not locate the output dataset you specified.  
System response:    The member you specified was not copied.  
User action:    Enter a valid output dataset name and try again.

**XPFE104E      COPY FAILED  
UNABLE TO ACQUIRE LCA CONTROL BLOCK.**

Explanation:    This is an internal error.  
System response:    The copy operation failed.  
User action:    Call Xerox Technical Support.

**XPFE105E      COPY FAILED  
UNABLE TO *operation* DATASET *dataset name*.**

Explanation:    This is an internal error.  
System response:    The copy operation failed.  
User action:    Call Xerox Technical Support.

**XPFE106E      COPY FAILED  
UNABLE TO FREE LCA CONTROL BLOCK.**

Explanation:    This is an internal error.  
System response:    The copy operation failed.  
User action:    Call Xerox Technical Support.

**XPFE107E      COPY FAILED  
MEMBER *member name* WAS NOT FOUND.**

Explanation:    The page format editor could not locate the named member.  
System response:    The copy operation failed.  
User action:    Enter the correct member name and try again.

- XPFE108E    INVALID BLOCK SIZE**  
**BLOCK SIZE** *block size* **IS NOT A MULTIPLE OF RECORD LENGTH** *record length value*.
- Explanation:    The block size must be a multiple of the named record length value.
- System response:    Dataset allocation failed.
- User action:    Enter a correct block size value and try again.
- 
- XPFE109E    INVALID BLOCK SIZE**  
**BLOCK SIZE** *block size* **MUST BE AT LEAST 4 BYTES LARGER THAN** *record length value*.
- Explanation:    The named block size must be at least four bytes larger than the named record length value.
- System response:    Dataset allocation failed.
- User action:    Enter a correct block size value and try again.
- 
- XPFE110E    DUPLICATE FORM ENTRIES**  
**DO NOT SPECIFY FORM NAME FOR BACK AND BFORM SIMULTANEOUSLY.**
- Explanation:    While editing a copy modification, you specified a value in both the 'Form Name for Back' and 'BFORM Name' fields. Only one name can be specified.
- System response:    The cursor is positioned on the 'BFORM Name' field. No further processing is permitted until the error is corrected.
- User action:    Delete the form name from either the 'BFORM Name' field or the 'Form Name for Back' field.
- 
- XPFE111E    INVALID FRONT SHIFT**  
**ENTER A VALUE FROM -75 TO 75 DOTS.**
- Explanation:    While editing a copy modification, you specified a front shift value outside the valid range.
- System response:    The cursor is positioned on the 'Front Shift Value' field. No further processing is permitted until the error is corrected.
- User action:    Either specify a value within the given range or delete the shift value completely.
- 
- XPFE112E    INVALID BACK SHIFT**  
**ENTER A VALUE FROM -75 TO 75 DOTS.**
- Explanation:    While editing a copy modification, you specified a back shift value outside the valid range.
- System response:    The cursor is positioned on the 'Back Shift Value' field. No further processing is permitted until the error is corrected.
- User action:    Either specify a value within the given range or delete the shift value completely.

**XPFE113E      INVALID SPLIT REPORT  
ENTER YES OR NO.**

Explanation:      While editing a copy modification, you entered an invalid value in the 'Split Report' field.

System response:      The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.

User action:      Enter **YES** or **NO**.

**XPFE114E      INVALID SF1 VALUE  
ENTER YES OR NO.**

Explanation:      While editing a copy modification, you entered an invalid value in the 'Signal Function 1' field.

System response:      The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.

User action:      Enter **YES** or **NO**.

**XPFE115E      INVALID SF2 VALUE  
ENTER YES OR NO.**

Explanation:      While editing a copy modification, you entered an invalid value in the 'Signal Function 2' field.

System response:      The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.

User action:      Enter **YES** or **NO**.

**XPFE116E      INVALID SEPARATOR PAGE  
ENTER YES OR NO.**

Explanation:      While editing a copy modification, you entered an invalid value in the 'Separator Page First' field.

System response:      The cursor is positioned on the field in error. No further processing is permitted until the error is corrected.

User action:      Enter **YES** or **NO**.

## XPL messages

---

### **XPL3702I      INSUFFICIENT STORAGE FOR ABEND WORK AREA. ESTAE NOT ESTABLISHED**

- Explanation: When entered from the Executor, the pipeline attempted to establish an ESTAE routine to handle pipeline processor abends. However, insufficient storage was available for the required work area.
- System response: Document processing continues without ESTAE protection. This message may be repeated for the document.
- User action: Free one or more of the printers active in the address space to relieve storage constraints. If the problem persists, terminate the XOSF address space and restart it with more memory.

### **XPL3703I      UNABLE TO ESTABLISH PIPELINE ABEND ROUTINE. RC=X'*return code*'**

- Explanation: When entered from the Executor, the pipeline attempted to establish an ESTAE routine to handle pipeline processor abends. However, XOSF was unable to establish the routine.
- System response: Document processing continues without ESTAE protection. This message may be repeated for the document.
- User action: If the problem persists, call Xerox Technical Support.

### **XPL3704I      PIPELINE PROCESSOR *module name* INSUFFICIENT STORAGE FOR WORK AREA**

- Explanation: When processing a document, the pipeline acquires a dynamic work area for each processor required. However, insufficient storage was available for the work area required by the named module.
- System response: Document processing is terminated.
- User action: Wait until another XPAF printer is drained, then resubmit the document. At the earliest opportunity, terminate the address space and increase the region size.

### **XPL3705I      EXCEPTIONAL CONDITIONS LIST HAS EXCEEDED THE 128 MAXIMUM**

- Explanation: The pipeline has sufficient storage for 128 exception conditions (return codes) to be reported. This number has been exceeded.
- System response: Document processing is terminated.
- User action: If the problem persists, call Xerox Technical Support.

**XPL3707I PIPELINE PROCESSOR *module name* WAS REMOVED FROM THE PAL BECAUSE OF AN ABEND**

Explanation: The pipeline ESTAE routine was invoked because of a programming error in the named processor. This message is preceded by a series of messages from the ESTAE processor indicating the error.

System response: Document processing is terminated.

User action: If the problem persists, call Xerox Technical Support.

**XPL6402E COULD NOT *command* ITEM *item name* IN TABLE *table name* activity. THM RC=X' *return code***

Explanation: The RGB values provided in the XES assign ink command did not have matching CMY values in the RGB-CMY-Color-Conv table.

System response: Document processing continues. The referenced color is set to black.

User action: Add the new RGB and CMY values to the COLR4700 entries in the RGB-CMY-Color-Conv table and rebuild the color conversion tables.

**XPL9990E PIPELINE PROCESSOR - *module name* - TERMINATED ABNORMALLY - SYSTEM CODE *abend code*, USER CODE *user code***

Explanation: This is an internal error.

System response: The XPAF FSS is terminated.

User action: Call Xerox Technical Support.

## XPS messages

---

**XPS4174W TRAY NUMBER MISSING FROM RECORD *recnum* IN THE POSTSCRIPT MEDIA LIST. RECORD STARTS WITH *text***

Explanation: An entry in the PostScript Media List Table does not contain a valid tray number.

Where:

*recnum* is the logical record number is the table that is missing a tray number

*text* displays the first 20 characters of the logical record at fault

System response: The record in error is ignored

User action: Correct record in error, in the PostScript Media list, and resubmit the job

**XPS4175W MAXIMUM SIZE OF THE POSTSCRIPT MEDIA LIST EXCEEDED WHEN PROCESSING RECORD NUMBER *recnum* IN THE POSTSCRIPT MEDIA LIST. RECORD STARTS WITH *text***

Explanation: The number (and size) of entries in the entry in the PostScript Media List Table has exceeded internal storage and there is no room does not contain a valid tray number.

Where:

*recnum* is the logical record number is the table that cannot be inserted into the table.

*text* displays the first 20 characters of the logical record at fault

System response: The record in error is ignored

User action: Correct the PostScript Media list, and resubmit the job. If all entries in the PS Media list table are requires, contact Xerox Technical Support.

## XRC messages

---

### **XRC0106F**     *module name* **LOAD OF translation table load module name FAILED**

- Explanation: An image could not be converted to Xerox format because the named load module could not be loaded. The load module may be missing from the load library, or storage may have been corrupted. This message is followed by message XRC6267F, which provides the member name of the unconverted image.
- System response: Whether XPAF recovers from this error and/or performs further processing is determined at a higher level.
- User action: Make sure that the load module name is valid and that the load module is in or is concatenated to the correct XPAF load library. If the problem persists, call Xerox Technical Support.

### **XRC3010F**     **COULD NOT GET X'*storage size*' BYTES OF MEMORY** *activity*

- Explanation: Insufficient storage was available for a particular image conversion function. *Storage size* identifies the amount of memory requested. *Activity* names the particular data structure, control block, or data storage buffer for which the memory allocation request failed.
- System response: The input image cannot be converted to Xerox format. Document processing is terminated, and the document remains in the output queue.
- User action: Increase the region size for the printer proc or rerun the job. If the problem persists, call Xerox Technical Support.

### **XRC3011E**     **COULD NOT RELEASE X'*storage size*' BYTES OF MEMORY FROM LOCATION X'*storage address*'** *activity*

- Explanation: Storage could not be freed for a particular image conversion function. *Storage size* identifies the amount of memory involved. *Storage address* identifies the location of that memory. *Activity* names the particular data structure, control block, or data storage buffer for which the memory release request failed.
- System response: The input image conversion to Xerox format is not directly affected by this error. However, if additional errors occur, document processing may be terminated, in which case the document remains in the output queue.
- User action: Reprint the document or resubmit the batch job. If the problem persists, call Xerox Technical Support.

**XRC3014E UNSUPPORTED IMAGE RESOLUTION OF XXX X YYY FOUND. NO IMAGE RE-SIZING WILL BE DONE.**

- Explanation: While processing an AFP data stream, an image was encountered with a resolution other than 240 or 300 Spots Per Inch.
- System response: Processing continues, but the image will not be resized to 300 Spots Per Inch. XPAF supports images at 240 SPI or 300 SPI only. 300 SPI images are printed as-is. 240 SPI images are translated to 300 SPI. Any other resolution encountered will have no translation applied, but will still be printed. This may cause the image to print smaller than expected.
- User action: Change the application to generate only 240 or 300 SPI images.

**XRC4004F** *module name* **DETECTED AN INVALID** *control block name* **CONTROL BLOCK AT LOCATION X'storage address'**

- Explanation: The named module determined that the named control block required for image conversion was not valid.
- System response: The input image cannot be converted to Xerox format. Document processing is terminated, and the document remains in the output queue.
- User action: A critical portion of the XPAF code is back-leveled, or recent program maintenance has been installed incorrectly. Call Xerox Technical Support.

**XRC6233F FATAL ERROR ENCOUNTERED BY** *module name* **DURING IMAGE VALIDATION PROCESSING IN** *module name*. **ERROR DUE TO MORE IMAGE/CELL DATA PRESENTED (IRD) THAN DEFINED (IIP/ICP)**

- Explanation: While processing an image resource, an IRD structured field was found to contain an excessive amount of raster data. The raster data was more than was specified in the preceding type of structured field. The IRD SF may apply to either the entire image (simple image) or at least one image cell (complex image). The preceding structured field, which specified the amount of raster data, was either an IID (simple image) or an ICP (complex image).
- System response: The image cannot be converted to .IMG format. This message is followed by message number XRC6267F, which provides more information.
- User action: Rebuild the image block of structured fields, specifying the correct amount of raster data. If the problem persists, call Xerox Technical support.

**XRC6254E INVALID DATA OR END OF DATA FOR** *resource member name* **ENCOUNTERED BEFORE** *eps structured field*

- Explanation: While processing an AFP overlay or page segment resource, an invalid non-SF record was detected, or an end-of-data condition occurred before the end of resource structured field was found.
- System response: Document processing is terminated. The document remains in the output queue.
- User action: Make sure that the named AFP overlay or page segment resource contains valid structured fields, including BMO/BPS and EMO/EPS structured fields and the start and end of the specified resource member. If not, recreate the AFP resource member correctly.

**XRC6255F FATAL ERROR ENCOUNTERED BY *module name*. data type NOT SUPPORTED**

- Explanation: XPAF's current IOCA support does not include support for Band Image Data, Numbered Image Data, the named data compression algorithm, Bits Per Pixel (BBP) greater than 1, or image orientations other than (0, 90).
- System response: XPAF rejects IOCA images that contain Band Image Data, Numbered Image Data, the named data compression algorithm, Bits Per Pixel (BBP) greater than 1, or image orientations other than (0, 90). Document processing terminates. This message is followed by message XRC6267F, which provides the image name. Whether XPAF recovers from this error or performs further processing is determined at a higher level.
- User action: Identify IOCA images that include Band Image Data (banded images), Numbered Image Data (tiled images), the named data compression algorithm, Bits Per Pixel (BBP) greater than 1, or image orientations other than (0, 90). Then choose one of these alternatives:
- Remove the images from the document data stream.
  - Regenerate the images in a form supported by XPAF.
- For information about XPAF-supported IOCA images, refer to [Section Four: Printing Documents with XPAF](#).
- After removing or regenerating the IOCA images in question, rerun the print job. If the problem persists, call Xerox Technical Support.

**XRC6261E SEVERE ERROR ENCOUNTERED BY *module name* DURING command LDM PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO activity FILE DDNAME *image library ddname***

- Explanation: If the error occurs during command LIBA, the native image library specified by *image library ddname* in the XOSF start-up proc could not be allocated. For all other commands (GLCA, LSTL, OPNO, PUT, STOW), this is an internal error. This message is followed by message XRC6268E, which provides more information.
- System response: Image conversion to .IMG format is not directly affected by this error. However, the converted image cannot be written to the image library.
- User action: Verify that the native image library specified in the XOSF start-up proc exists. If the problem persists, call Xerox Technical Support.

**XRC6262W MINOR ERROR ENCOUNTERED BY *module name* DURING command LDM PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO activity FILE DDNAME *image library ddname***

- Explanation: This is an internal error.
- System response: Image conversion to .IMG format is not directly affected by this error. Unless a more severe error occurs, this message is followed by message XRC6266I which provides more information.
- User action: Call Xerox Technical Support.

**XRC6263F FATAL ERROR ENCOUNTERED BY *module name* DURING *command* BUFFER STORAGE MANAGEMENT PROCESSING *activity* DATA RECORDS. RC=X'return code'; IC=X'information code'**

Explanation: This is an internal error.

System response: The image cannot be converted to .IMG format. This message is followed by message XRC6267F, which provides more information.

User action: Call Xerox Technical Support.

**XRC6264E MINOR ERROR ENCOUNTERED BY *calling module name* DURING IMAGE activity PROCESSING IN *called module name*. RC=X'return code'; IC=X'information code'**

Explanation: A minor error was experienced by the named called module, resulting in a return code greater than 4 being returned to the named calling module during image processing of the identified *activity*.

System response: Processing continues, unless a more severe error occurs. This message is followed by messages XRC6266I, XRC6267F, or XRC6268E, which identify the offending image and indicate the final outcome. Unless message XRC6266I is issued, the input image cannot be converted to Xerox format, in which case document processing is terminated, and the document remains in the output queue.

User action: Refer to the user actions for any associated messages. Then reprint the document or resubmit the batch job. If the problem persists, call Xerox Technical Support.

**XRC6265F FATAL ERROR ENCOUNTERED BY *calling module name* DURING IMAGE activity PROCESSING IN *called module name*. RC=X'return code'; IC=X'information code'**

Explanation: A fatal error was experienced by the named called module, resulting in a return code greater than 4 being returned to the named calling module during image processing of the identified *activity*.

System response: The input image cannot be converted to Xerox format. This message is followed by messages XRC6267F or XRC6268E which identify the offending image. Document processing is terminated, and the document remains in the output queue.

User action: Refer to the user actions for any associated messages. Then reprint the document or resubmit the batch job. If the problem persists, call Xerox Technical Support.

**XRC6266I IMAGE NAMED *image member name* CONVERTED SUCCESSFULLY TO RES/.IMG FORMAT**

Explanation: The image was converted despite prior errors.

System response: Processing continues normally.

User action: Correct any problems identified by preceding messages for this image. If the problem persists, call Xerox Technical Support.

**XRC6267F IMAGE NAMED *image member name* NOT CONVERTED TO RES/.IMG FORMAT**

Explanation: The image was not converted to .IMG format.

System response: Error recovery and/or further processing by XPAF is determined at a higher level.

User action: Correct any problems identified by the preceding messages and process the document again. If the problem persists, call Xerox Technical Support.

**XRC6268E IMAGE NAMED *image member name* CONVERTED SUCCESSFULLY TO RES/.IMG FORMAT, BUT THE MEMBER COULD NOT BE WRITTEN CORRECTLY TO THE OUTPUT LIBRARY**

Explanation: Despite prior errors, the image was converted to .IMG format. However, because of a serious failure by the LDM component, the converted image could not be stored permanently in the native image library that was specified.

System response: Further XPAF processing is determined at a higher level.

User action: Correct any problems identified by preceding messages for this image. If the problem persists, call Xerox Technical Support.

**XRC6281F FATAL ERROR ENCOUNTERED BY *module name* DURING *activity* BUILD PROCESSING. MAXIMUM NUMBER OF *image maximum number* ENTRIES EXCEEDED, FOR *type* RESOURCE NAMED *member name (transform type)*. IC=X'*information code*'**

Explanation: This is an internal error. *Type* is one of these items: page segment, overlay, or image page. For module name XRCIRAW, this message is followed by message number XRC6267F, which provides more information.

System response: Raw images are not consolidated, and the image is not converted to .IMG format.

User action: For centralized printers, the IMAGEMAXO, IMAGEMAXP, and IMAGEMAXS printer profile parameters can be used to specify a greater maximum number of overlays, image pages, and page segments, respectively, correcting this problem.

**XRC6300I**    **INFORMATION MESSAGE ISSUED BY** *module name* **DURING** *image library member* **PROCESSING. DUE TO THE PRECEDING** *severity* **ERROR, action, FOR type RESOURCE NAMED** *resource member name (transform type)*

Explanation:    This message is issued to clarify the recovery action being taken as a result of the preceding error. An attempted course of action failed and is being substituted with a new course of action. The error and recovery actions are:

- A native image library member could not be opened by LDM; therefore, conversion of the original IBM overlay must be performed.
- A Metacode record could not be stored by the buffer manager; therefore, conversion of the original IBM overlay must be performed.
- A native image library member record could not be read by LDM; therefore, conversion of the original IBM overlay must be performed.

System response:    The conversion to Xerox format is not directly affected by this error. *Type* is one of these items: overlay, page segment, or form. *Severity* for this error is minor.

User action:    None required.

**XRC6301W**    **WARNING MESSAGE ISSUED BY** *module name* **DURING** *item* **PROCESSING. DUE TO THE PRECEDING** *severity* **ERROR, action FOR type RESOURCE NAMED** *resource member name (transform type)*

Explanation:    This message is issued to clarify the recovery action being taken as a result of the preceding error. An attempted course of action failed and is being substituted with a new course of action. The error results from one of these conditions:

- An IBM overlay library member was not found by LDM; therefore, conversion or revision of the original IBM overlay cannot be performed. *Severity* for this error is severe.
- A revision list item could not be retrieved by THM for some reason other than not found; therefore, conversion or revision of the original IBM overlay cannot be determined or performed. *Severity* for this error is minor.
- An IBM page segment library member was not found by LDM; therefore conversion or revision of the original IBM page segment cannot be performed. *Severity* for this error is severe.

System response:    The conversion to Xerox format is not directly affected by this error; however, any requested revisions will not be performed.

User action:    If necessary, call Xerox Technical Support.

**XRC6307E**    **MINOR ERROR ENCOUNTERED BY** *module name* **DURING** *command* **LDM** *command description* **PROCESSING. RC=X'***return code***; IC=X'***information code***. UNABLE TO** *activity* **FILE DDNAME** *library ddname*, **FOR** *type* **RESOURCE NAMED** *resource member name* *(transform type)*

Explanation:    This is an internal error.

System response:    The conversion to Xerox format was not directly affected by this error. However, a preceding allocation failure may affect the final processing outcome. *Type* is one of these items: overlay, form, or page segment.

User action:    Call Xerox Technical Support.

**XRC6308E**    **SEVERE ERROR ENCOUNTERED BY** *module name* **DURING** *command* **LDM** *command description* **PROCESSING. RC=X'***return code***; IC=X'***information code***. UNABLE TO** *activity* **FILE DDNAME** *library ddname*, **FOR** *type* **RESOURCE NAMED** *resource member name* *(transform type)*

Explanation:    If *type* is overlay or form, revision of an overlay was requested, but the equivalent original IBM overlay required for the conversion was not found in the IBM overlay library. If *type* is page segment, this is an internal error.

System response:    If *type* is overlay, conversion to Xerox format was not directly affected by this error, except that the requested revision attempt will not be performed. Consequently, this may affect the final appearance of the printed document.

                    If *type* is form, processing of the Xerox native form was not directly affected by this error.

                    If *type* is page segment, conversion of the page segment to Xerox format cannot be performed. Processing continues, since this error may have occurred for images of the page segment having a different orientation than the original. If the error occurred for the original orientation, this message is followed by message XRC6301W, which provides more information.

User action:    If *type* is overlay or form and if the revision is required, check that the overlay is correctly identified as being a revision. Ensure that the equivalent IBM member exists in the appropriate IBM overlay library, as specified by the XOSF start-up proc, and is available for use by the transform type. If *type* is page segment, call Xerox Technical Support.

**XRC6309F**    **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *command* **LDM** *command description* **PROCESSING. RC=X'***return code***; IC=X'***information code***. UNABLE TO** *activity* **FILE DDNAME** *library ddname*, **FOR** *type* **RESOURCE NAMED** *resource member name* *(transform type)*

Explanation:    This is usually an XPAF internal error. If there was an allocation error, the library specified by *library ddname* in the XOSF start-up proc could not be allocated using LDM.

System response:    The *type* could not be converted to Xerox format. Document processing stops, and the document remains in the output queue. *Type* is one of these items: overlay, form, or page segment.

User action:    If there was an allocation error, verify that the library specified in the XOSF start-up proc exists. If the problem persists, call Xerox Technical Support.

**XRC6312E**    **MINOR ERROR ENCOUNTERED BY** *module name* **DURING THM command description PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO** *activity* **FOR type TYPE RESOURCE NAMED** *resource member name (transform type)*

Explanation:    This is an internal error.

System response:    The *type* conversion to Xerox format is not directly affected by this error. However, if a revision attempt is requested, the revision will not be done. *Type* is one of these items: overlay, form, or page segment.

User action:    Call Xerox Technical Support.

**XRC6314F**    **FATAL ERROR ENCOUNTERED BY** *module name* **DURING THM command description PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO** *activity description*, **FOR OVERLAY TYPE RESOURCE NAMED** *resource member name (transform type)*

Explanation:    This is an internal error.

System response:    The *type* cannot be converted to Xerox format. *Type* is one of these items: overlay, form, or page segment. Document processing stops. The document remains in the output queue.

User action:    Call Xerox Technical Support.

**XRC6317E**    **MINOR ERROR ENCOUNTERED BY** *module name* **DURING activity BUFFER STORAGE MANAGEMENT PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO** *activity* **DATA BUFFER, FOR type RESOURCE NAMED** *resource member name (transform type)*

Explanation:    This is an internal error.

System response:    The conversion to Xerox format (if *type* is overlay or page segment) or processing of native form (if *type* is form) is not directly affected by this error.

User action:    Call Xerox Technical Support.

**XRC6318E**    **SEVERE ERROR ENCOUNTERED BY** *module name* **DURING activity BUFFER STORAGE MANAGEMENT PROCESSING. RC=X'return code'; IC=X'buffer control block address'. UNABLE TO** *activity* **DATA BUFFER, FOR type RESOURCE NAMED** *ibm member name (transform type)*

Explanation:    This is an internal error.

System response:    The page segment cannot be converted to Xerox format. Processing continues since this error may have occurred for images of the page segment with a different orientation than the original. The printed document may not be directly affected by this error. If the error occurred for the original orientation, this message is followed by message XRC6301W, which provides more information.

User action:    Call Xerox Technical Support.

**XRC6319F**    **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *activity* **BUFFER STORAGE MANAGEMENT PROCESSING. RC=X'return code'**; IC=X'**buffer control block address'. **UNABLE TO** *activity* **DATA BUFFER, FOR** *type* **RESOURCE NAMED** *resource member name (transform type)***

Explanation:    This is an internal error.

System response:    The *type* cannot be converted to Xerox format (if *type* is overlay or page segment) or processing of the Xerox native form cannot be done (if *type* is form). Document processing stops. The document remains in the output queue.

User action:    Call Xerox Technical Support.

**XRC6320I**    **INFORMATION MESSAGE ISSUED BY** *module name* **DURING** *activity* **LDM command description** **PROCESSING. action** **MEMBER NAMED** *member name from FILE DDNAME library ddname,* **FOR** *type* **RESOURCE NAMED** *resource member name (transform type)*

Explanation:    This message is issued when a redundant library member is successfully deleted. It provides an audit trail.

System response:    The conversion to Xerox format (if *type* is overlay or page segment) or processing of the native form (if *type* is form) is not directly affected by this message.

User action:    None required.

**XRC6321W**    **WARNING MESSAGE ISSUED BY** *module name* **DURING** *activity* **LDM command description** **PROCESSING. action** **MEMBER NAMED** *member name from FILE DDNAME library ddname,* **FOR** *page segment* **RESOURCE NAMED** *ibm member name (transform type)*

Explanation:    This message is issued when an invalid library member is successfully deleted. It provides an audit trail.

System response:    The page segment conversion to Xerox format is not directly affected by this message.

User action:    None required.

**XRC6325I**    **INFORMATION MESSAGE ISSUED BY** *module name* **DURING** **THM** *thm command description* **PROCESSING. activity with** **ITEM KEY** *thm insert item key,* **FOR** *type* **RESOURCE NAMED** *resource member name (transform type)*

Explanation:    This message is issued when a new item is successfully added to the list of required revisions. It provides an audit trail.

System response:    The conversion to Xerox format (if *type* is overlay or page segment) or processing of the native form (if *type* is form) is not directly affected by this message.

User action:    None required.

**XRC6352E** **MINOR ERROR ENCOUNTERED BY** *module name* **DURING** *activity* **PROCESSING BY** *component*. **RC=X'***return code***;** **IC=X'***current image address***'**. *action* **FOR type RESOURCE NAMED** *ibm member name (transform type)*

Explanation: The image resource conversion processor encountered a minor problem while converting an IBM page segment into Xerox format (for the XRCIRAW component) or while consolidating or modifying the composite images of an IBM page segment into Xerox format (for the XRCIMAGE component).

System response: The page segment conversion to Xerox format is not directly affected by this error.

User action: Investigate any messages logged by XRCIRAW or XRCIMAGE to diagnose and resolve the problem. If the problem continues, call Xerox Technical Support.

**XRC6353E** **SEVERE ERROR ENCOUNTERED BY** *module name* **DURING** *activity* **PROCESSING BY** *component*. **RC=X'***return code***;** **IC=X'***current image address***'**. *action* **FOR type RESOURCE NAMED** *ibm member name (transform type)*

Explanation: The image resource conversion processor encountered a severe problem while converting an IBM page segment into Xerox format (for component XRCIRAW) or while consolidating or modifying the composite images of an IBM page segment into Xerox format (for the XRCIMAGE component).

System response: The page segment conversion to Xerox format cannot be performed. Processing continues since this error may have occurred for images of the page segment with a different orientation than the original. The printed document may not be directly affected by this error. If the error occurred for the original orientation, this message is followed by message XRC6301W, which provides more information.

User action: Investigate any messages logged by XRCIRAW or XRCIMAGE to diagnose and resolve the problem. If the problem continues, call Xerox Technical Support.

**XRC6354F** **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *activity* **PROCESSING BY** *conversion program*. **RC='***return code***;** **IC=X'***address***'**. *action/reason*, **FOR type RESOURCE NAMED** *resource member name (transform type)*

Explanation: For XRCOVLAY, the specified conversion encountered a fatal error while attempting to convert an IBM overlay to the specified format. For XRCMERGE and XRCIRAW, this is an internal error.

System response: For XRCOVLAY, the overlay cannot be converted to Xerox format. Document processing is terminated. The document remains in the output queue.

For XRCMERGE and XRCIRAW, raw images are not consolidated, and the image is not converted to .IMG format. If the issuing module is XRCIRAW, this message is followed by message XRC6267F, which provides the image name.

User action: To help diagnose and resolve the problem, follow these guidelines:

- For XRCOVLAY, investigate any messages logged by XAM modules or any other messages issued by XRCOVLAY, XRCIMAGE, or XRCPSEG. If the problem persists, call Xerox Technical Support.
- For XRCMERGE and XRCIRAW, call Xerox Technical Support.

**XRC6356I** **INFORMATION MESSAGE ISSUED BY** *module name* **DURING CREATION PROCESSING.**  
**FORMAT=***xerox image format***; #COLORS=***image number of colors***; COLOR=***image primary color***; NAME=***image member name*

Explanation: This message identifies and describes the resulting format of a Xerox .IMG or RES .IMG file that XPAF has successfully converted from an IBM AFP image. The variable definitions are:

- *Xerox image format* is either IMG or RES.
- *Image number of colors* is either 0, 1, or 2. For a .IMG file, the number of colors is always 0.
- *Image primary color* is either BLACK for a .IMG file or the determined color for a RES .IMG file. For images with two colors, the second color is always BLACK.
- *Image member name* is either the Xerox file member name or INLINE IMAGE PAGE for those images that are in line graphics.

System response: Processing continues normally.

User action: None required. You may review the output from XPAF for illustrations of the converted images.

**XRC6390F** **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *type of* **PROCESSING, DUE TO** *reason***, FOR TYPE RESOURCE NAMED** *form member name* **(transform type)**

Explanation: For native mode processing, the document requested a native centralized form that is not supported for decentralized printers. For category determination processing, this is an internal error. For resource conversion processing, the input IBM overlay contained no valid data that is recognized by XPAF.

System response: Conversion cannot be performed. Document processing stops, and the document remains in the output queue.

User action: For native mode processing, correct the data stream to either print on a centralized printer or to use the correct decentralized form. For resource conversion processing, correct the data stream to use a valid overlay or form, or to not reference the invalid IBM overlay. For category determination processing, call Xerox Technical Support.

**XRC6391F** **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *type of* **PROCESSING.**  
**RESOURCE NAME PREFIX IS** *member name prefix***, NOT OM NOR OU.** *status***, FOR TYPE TYPE RESOURCE NAMED** *form member name*

Explanation: This is an internal error.

System response: Conversion of the overlay to Xerox format cannot be performed. Document processing stops, and the document remains in the output queue.

User action: Call Xerox Technical Support.

**XRC6392W** **MINOR ERROR ENCOUNTERED BY** *module name* **DURING** *type of* **PROCESSING.**  
**IC=X'***reason code***'.** **TRANSFORM CONVERSION CONTINUES, FOR** *type* **TYPE**  
**RESOURCE NAMED** *form member name (transform type)*

Explanation: This message is issued when an inconsistency between member names in the form and image libraries occurs.

System response: Conversion of the overlay is not directly affected by this error.

User action: None required.

**XRC6393W** **WARNING MESSAGE ISSUED BY** *module name* **DURING** *type of* **PROCESSING, DUE TO**  
*reason. result*

Explanation: This message is issued as a result of one of these conditions:

- The data stream contains images that have different resolutions within the same resource.
- A begin image/end image sequence is detected but no image raster data is found.

System response: For images having different resolutions, image processing continues. The resolution of the first image encountered within the resource is used for all other images in that resource.

For begin image/end image sequences, images are ignored and processing continues.

User action: For images having different resolutions, change the individual images in the resource to the same resolution and resubmit the job.

For begin image/end image sequences, verify that the resource specified is correct and resubmit the job.

**XRC6394W** **WARNING MESSAGE ISSUED BY** *module name* **DURING** *activity* **PROCESSING.** *action,*  
**FOR** *type* **RESOURCE NAMED** *resource member name (transform type)*

Explanation: The consolidated image could not be positioned correctly on the physical page.

System response: The image may be mispositioned, or it may be missing completely from the page.

User action: Change the position and/or size of the images so they can fit on the physical page.

**XRC6395F FATAL ERROR ENCOUNTERED BY *module name* DURING *parameter* VALIDATION PROCESSING, (*problem description*)**

- Explanation: If *module name* is XRCBATCH, the JCL parameter field contains one or more keywords that either have an incorrect name length or are not valid keywords. If *module name* is XRCRES12, one or more of the input parameters is invalid. In all cases, *problem description* identifies the invalid keyword or parameter.
- System response: The input image cannot be converted to Xerox format. Either document processing is terminated and the document remains in the output queue, or two-color RES .IMG file member separation is terminated.
- User action: Correct the keyword or parameter error. Then reprint the document or resubmit the batch job. If the problem persists, call Xerox Technical Support.

**XRC6396E MINOR ERROR ENCOUNTERED BY XRCBATCH DURING *activity* PROCESSING, (*failure explanation*). REFER TO ANY PREVIOUS MESSAGES FOR MORE INFORMATION**

- Explanation: This is an internal error.
- System response: Storage corruption may have occurred. This error does not directly affect separation of the two-color RES .IMG file member(s). Image processing is already complete.
- User action: Preceding messages may help explain the cause of the problem. If the problem persists, call Xerox Technical Support.

**XRC6397F FATAL ERROR ENCOUNTERED BY XRCBATCH DURING *activity* PROCESSING, (*failure explanation*). REFER TO ANY PREVIOUS MESSAGES FOR MORE INFORMATION**

- Explanation: This is an internal error.
- System response: The two-color RES .IMG file member(s) cannot be separated. Image processing is terminated.
- User action: Preceding messages may help explain the cause of the problem. If the problem persists, call Xerox Technical Support.

**XRC6398I THE VALUE OF KEYWORD *keyword* IS: *data value*. IF INCORRECT, CHECK THE JCL PARM= STATEMENT**

- Explanation: This message identifies the named keyword and corresponding parameter value being used for this execution of XRCBATCH.
- System response: None.
- User action: If *data value* for the named keyword is correct, no action is needed. If *data value* for the named keyword is unexpected or incorrect, check the syntax and validity of the named parameter value. Correct any errors, and then reprint the document or resubmit the batch job. If the problem persists, call Xerox Technical Support.

- XRC6399E**     **SEVERE ERROR ENCOUNTERED BY XRCBATCH DURING** *activity description*  
**PROCESSING OF** *type of resource* **RESOURCE NAMED** *resource name*. **RC=X**'return  
*code*'; **IC=X**'information code'
- Explanation:     This message is issued as a result of a non-zero return code from XRFIMGDC, XRCRES12, XRFCOMPS, or XRFCOMPT. Preceding messages may explain the cause of the problem.
- System response:     The two-color RES .IMG file member identified by *resource name* cannot be separated. Processing of other resources continues.
- User action:     Examine the log for additional information about the error, and take any action indicated. Reprint the document or resubmit the batch job. If the problem persists, call Xerox Technical Support.
- 
- XRC6417F**     **RESOURCE** *resource member name*, **TYPE** *resource type* **FAILED EXIT 6**  
**AUTHORIZATION**
- Explanation:     The current user exit 06 has instructed XPAF not to allow the user to access this particular resource.
- System response:     The current print job is aborted.
- User action:     Contact your systems programmer for information on the operation of user exit 06 at your site.
- 
- XRC6500I**     **XEROX TWO-COLOR RES FILE** *image member name* **CONVERTED TO** *resource type* **FILE**  
*image member name*
- Explanation:     This message identifies the Xerox two-color RES .IMG file member that has been successfully converted to a single Xerox monochrome file or divided into two Xerox monochrome separations via XRCBATCH.
- System response:     Processing continues.
- User action:     None required. You may review the output from XRCBATCH for a list of all converted two-color RES .IMG files.

## XRD messages

---

### **XRD0106F**     *module name* **LOAD OF translation table load module name FAILED**

- Explanation: An image could not be converted to Xerox format because the named load module could not be loaded. The load module may be missing from the load library, or storage may have been corrupted. This message is followed by message XRD6267F, which provides the member name of the unconverted image.
- System response: Whether XPAF recovers from this error and/or performs further processing is determined at a higher level.
- User action: Make sure the load module name is valid and that the load module is in or is concatenated to the correct XPAF load library. If the problem persists, call Xerox Technical Support.

### **XRD3010F**     **COULD NOT GET X'*storage size*' BYTES OF MEMORY** *activity*

- Explanation: Insufficient storage was available for a particular image conversion function. *Storage size* identifies the amount of memory requested. *Activity* names the particular data structure, control block, or data storage buffer for which the memory allocation request failed.
- System response: The input image cannot be converted to Xerox format. Document processing is terminated, and the document remains in the output queue.
- User action: Increase the region size for the printer proc or rerun the job. If the problem persists, call Xerox Technical Support.

### **XRD3011E**     **COULD NOT RELEASE X'*storage size*' BYTES OF MEMORY FROM LOCATION X'*storage address*'** *activity*

- Explanation: Storage could not be freed for a particular image conversion function. *Storage size* identifies the amount of memory involved. *Storage address* identifies the location of that memory. *Activity* names the particular data structure, control block, or data storage buffer for which the memory release request failed.
- System response: The input image conversion to Xerox format is not directly affected by this error. However, if additional errors occur, document processing may be terminated, in which case the document remains in the output queue.
- User action: Reprint the document or resubmit the batch job. If the problem persists, call Xerox Technical Support.

**XRD3014E UNSUPPORTED IMAGE RESOLUTION OF XXX X YYY FOUND. NO IMAGE RE-SIZING WILL BE DONE.**

- Explanation: While processing an AFP data stream, an image was encountered with a resolution other than 240 or 300 Spots Per Inch.
- System response: Processing continues, but the image will not be resized to 300 Spots Per Inch. XPAF supports images at 240 SPI or 300 SPI only. 300 SPI images are printed as-is. 240 SPI images are translated to 300 SPI. Any other resolution encountered will have no translation applied, but will still be printed. This may cause the image to print smaller than expected.
- User action: Change the application to generate only 240 or 300 SPI images.

**XRD3015E COULD NOT *command* LIBRARY *library ddname activity*. LDM RC=X'return code'**

- Explanation: XPAF could not perform the named *activity* on the specified library.
- System response: Document processing is terminated. The document remains in the output queue.
- User action: Ensure the library exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XRD3016E COULD NOT *command* MEMBER *member name* OF LIBRARY *library ddname resource type library*. LDM RC=X'return code'**

- Explanation: XPAF could not perform the named *command* on the specified member.
- System response: Document processing is terminated. The document remains in the output queue.
- User action: Ensure the member exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XRD3017E COULD NOT *command* LCA FOR FORMDEF LIBRARY. LDM RC=X'return code'**

- Explanation: This is an internal error.
- System response: Document processing is terminated. The document remains in the output queue.
- User action: Call Xerox Technical Support.

- XRC4004F**     *module name* **DETECTED AN INVALID** *control block name* **CONTROL BLOCK AT LOCATION X'***storage address'*
- Explanation:     The named module determined that the named control block required for image conversion was not valid.
- System response:     The input image cannot be converted to Xerox format. Document processing is terminated, and the document remains in the output queue.
- User action:     A critical portion of the XPAF code is back-leveled, or recent program maintenance has been installed incorrectly. Call Xerox Technical Support.
- 
- XRD4005E**     **THM ERROR DURING** *command* **FOR** *table type*, **ITEM KEY** *item key*. **THM IC=X'***information code'*; **RC=X'***return code'*
- Explanation:     This is an internal error.
- System response:     Document processing is terminated. The document remains in the output queue.
- User action:     Call Xerox Technical Support.
- 
- XRD4022E**     **ERROR DELETING** *image member name* **FROM** *printer proc* **IMAGE LIBRARY** *image library ddname*
- Explanation:     This is an internal error.
- System response:     Document processing continues normally. This error does not affect overlay conversion or revision.
- User action:     Call Xerox Technical Support.
- 
- XRD4326E**     **ERROR** *activity* **DATA BUFFER**
- Explanation:     This is an internal error.
- System response:     Document processing is terminated. The document remains in the output queue.
- User action:     Call Xerox Technical Support.
- 
- XRD4327I**     **ERROR CONVERTING** *member name* **IN LIBRARY** *library ddname library dsname*
- Explanation:     This is an internal error.
- System response:     Document processing is terminated. The document remains in the output queue.
- User action:     Call Xerox Technical Support.
- 
- XRD6233F**     **FATAL ERROR ENCOUNTERED BY** *module name* **DURING IMAGE VALIDATION PROCESSING IN** *module name*. **ERROR DUE TO MORE IMAGE/CELL DATA PRESENTED (IRD) THAN DEFINED (IID/ICP)**
- Explanation:     While processing an image resource, an IRD structured field was found to contain an excessive amount of raster data. The raster data was more than was specified in the preceding type of structured field. The IRD SF

may apply to either the entire image (simple image) or at least one image cell (complex image). The preceding structured field, which specified the amount of raster data, was either an IID (simple image) or an ICP (complex image).

System response: The image cannot be converted to .IMG format. This message is followed by message number XRD6267F, which provides more information.

User action: Rebuild the image block of structured fields, specifying the correct amount of raster data. If the problem persists, call Xerox Technical support.

**XRD6254E INVALID DATA OR END OF DATA FOR *resource member name* ENCOUNTERED BEFORE *eps structured field***

Explanation: While processing an AFP overlay or page segment resource, an invalid non-SF record was detected, or an end-of-data condition occurred before the end of resource structured field was found.

System response: Document processing is terminated. The document remains in the output queue.

User action: Make sure that the named AFP overlay or page segment resource contains valid structured fields, including BMO/BPS and EMO/EPS structured fields and the start and end of the specified resource member. If not, recreate the AFP resource member correctly.

**XRD6255F FATAL ERROR ENCOUNTERED BY *module name*. *data type* NOT SUPPORTED**

Explanation: XPAF's current IOCA support does not include support for Band Image Data, Numbered Image Data, the named data compression algorithm, Bits Per Pixel (BBP) greater than 1, or image orientations other than (0, 90).

System response: XPAF rejects IOCA images that contain Band Image Data, Numbered Image Data, the named data compression algorithm, Bits Per Pixel (BBP) greater than 1, or image orientations other than (0, 90). Document processing terminates. This message is followed by message XRD6267F, which provides the image name. Whether XPAF recovers from this error or performs further processing is determined at a higher level.

User action: Identify IOCA images that include Band Image Data (banded images), Numbered Image Data (tiled images), the named data compression algorithm, Bits Per Pixel (BBP) greater than 1, or image orientations other than (0, 90). Then choose one of these alternatives:

- Remove the images from the document data stream.
- Regenerate the images in a form supported by XPAF.

For information about XPAF-supported IOCA images, refer to [Section Four: Printing Documents with XPAF](#).

After removing or regenerating the IOCA images in question, rerun the print job. If the problem persists, call Xerox Technical Support.

**XRD6261E SEVERE ERROR ENCOUNTERED BY *module name* DURING command LDM PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO activity FILE DDNAME *image library ddname***

Explanation: If the error occurs during command LIBA, the native image library specified by *image library ddname* in the XOSF start-up proc could not be allocated. For all other commands (GLCA, LSTL, OPNO, PUT, STOW), this is an internal error. This message is followed by message XRD6268E, which provides more information.

System response: Image conversion to .IMG format is not directly affected by this error. However, the converted image cannot be written to the image library.

User action: Verify that the native image library specified in the XOSF start-up proc exists. If the problem persists, call Xerox Technical Support.

**XRD6262E MINOR ERROR ENCOUNTERED BY *module name* DURING command LDM PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO activity FILE DDNAME *image library ddname***

Explanation: This is an internal error.

System response: Image conversion to .IMG format is not directly affected by this error. Unless a more severe error occurs, this message is followed by message XRD6266I which provides more information.

User action: Call Xerox Technical Support.

**XRD6263F FATAL ERROR ENCOUNTERED BY *module name* DURING command BUFFER STORAGE MANAGEMENT PROCESSING activity DATA RECORDS. RC=X'return code'; IC=X'information code'**

Explanation: This is an internal error.

System response: The image cannot be converted to .IMG format. This message is followed by message XRD6267F, which provides more information.

User action: Call Xerox Technical Support.

**XRD6264E MINOR ERROR ENCOUNTERED BY *calling module name* DURING IMAGE activity PROCESSING IN *called module name*. RC=X'return code'; IC=X'information code'**

Explanation: A minor error was experienced by the named called module, resulting in a return code greater than 4 being returned to the named calling module during image processing of the identified *activity*.

System response: Processing continues, unless a more severe error occurs. This message is followed by messages XRC6266I, XRC6267F, or XRC6268E, which identify the offending image and indicate the final outcome. Unless message XRC6266I is issued, the input image cannot be converted to Xerox format, in which case document processing is terminated, and the document remains in the output queue.

User action: Refer to the user actions for any associated messages. Then reprint the document or resubmit the batch job. If the problem persists, call Xerox Technical Support.

**XRD6265F FATAL ERROR ENCOUNTERED BY *calling module name* DURING IMAGE activity PROCESSING IN *called module name*. RC=X'return code'; IC=X'information code'**

- Explanation: A fatal error was experienced by the named called module, resulting in a return code greater than 4 being returned to the named calling module during image processing of the identified *activity*.
- System response: The input image cannot be converted to Xerox format. This message is followed by messages XRC6267F or XRC6268E which identify the offending image. Document processing is terminated, and the document remains in the output queue.
- User action: Refer to the user actions for any associated messages. Then reprint the document or resubmit the batch job. If the problem persists, call Xerox Technical Support.

**XRD6266I IMAGE NAMED *image member name* CONVERTED SUCCESSFULLY TO RES/.IMG FORMAT**

- Explanation: The image was converted despite prior errors.
- System response: Processing continues normally.
- User action: Correct any problems identified by preceding messages for this image. If the problem persists, call Xerox Technical Support.

**XRD6267F IMAGE NAMED *image member name* NOT CONVERTED TO RES/.IMG FORMAT**

- Explanation: The image was not converted to .IMG format.
- System response: Error recovery and/or further processing by XPAF is determined at a higher level.
- User action: Correct any problems identified by the preceding messages and process the document again. If the problem persists, call Xerox Technical Support.

**XRD6268E IMAGE NAMED *image member name* CONVERTED SUCCESSFULLY TO RES/.IMG FORMAT, BUT THE MEMBER COULD NOT BE WRITTEN CORRECTLY TO THE OUTPUT LIBRARY**

- Explanation: Despite prior errors, the image was converted to .IMG format. However, because of a serious failure by the LDM component, the converted image could not be stored permanently in the Xerox output native image library that was specified.
- System response: Further XPAF processing is determined at a higher level.
- User action: Correct any problems identified by preceding messages for this image. If the problem persists, call Xerox Technical Support.

**XRD6290E THE FOLLOWING ERRORS OCCURED DURING PROCESSING OF A *object\_type***

- Explanation: An error occurred when processing an AFP object type of *object\_type*. Additional messages follow
- System response: Dependent on the severity of the error.
- User action: Check the XOSFLOG for additional messages.

**XRD6291E**     *message\_text*

Explanation:     An error occurred when converting either an AFP Bar Code or Graphic. This is an internal error caused by a condition not handled by the conversion routines.

System response:     Dependent on the severity of the error.

User action:     contact Xerox Technical Support.

**XRD6300I**     **INFORMATION MESSAGE ISSUED BY** *module name* **DURING** *item* **PROCESSING. DUE TO THE PRECEDING** *severity* **ERROR, action, FOR OVERLAY RESOURCE NAMED** *resource member name (transform type)*

Explanation:     This message is issued to clarify the recovery action being taken as a result of the preceding error. An attempted course of action failed and is being substituted with a new course of action. The error and recovery actions are:

- A native image library member could not be opened by LDM; therefore, conversion of the original IBM overlay must be performed.
- A Metacode record could not be stored by the buffer manager; therefore, conversion of the original IBM overlay must be performed.
- A native image library member record could not be read by LDM; therefore, conversion of the original IBM overlay must be performed.

System response:     The conversion to Xerox format is not directly affected by this error.

User action:     None required.

**XRD6301W**     **WARNING MESSAGE ISSUED BY** *module name* **DURING** *item* **PROCESSING. DUE TO THE PRECEDING** *severity* **ERROR, action, FOR type RESOURCE NAMED** *resource member name (transform type)*

Explanation:     This message is issued to clarify the recovery action being taken as a result of the preceding error. An attempted course of action failed and is being substituted with a new course of action. The error results from one of these conditions:

- An IBM overlay library member was not found by LDM; therefore, conversion or revision of the original IBM overlay cannot be performed. *Severity* for this error is severe.
- A revision list item could not be retrieved by THM for some reason other than not found; therefore, conversion or revision of the original IBM overlay cannot be determined or performed. *Severity* for this error is minor.
- An IBM page segment library member was not found by LDM; therefore conversion or revision of the original IBM page segment cannot be performed. *Severity* for this error is severe.

System response:     The conversion to Xerox format is not directly affected by this error; however, any requested revisions will not be performed.

User action:     If necessary, call Xerox Technical Support.

**XRD6307E** **MINOR ERROR ENCOUNTERED BY** *module name* **DURING** *command* **LDM** *command description* **PROCESSING. RC=X'***return code***; IC=X'***information code***. UNABLE TO** *activity* **FILE DDNAME** *library ddname*, **FOR** *type* **RESOURCE NAMED** *resource member name* *(transform type)*

Explanation: This is an internal error.

System response: The conversion to Xerox format was not directly affected by this error. However, a preceding allocation failure may affect the final processing outcome.

User action: If a resource revision is being done, ensure that you have performed a library refresh.

**XRD6308E** **SEVERE ERROR ENCOUNTERED BY** *module name* **DURING** *command* **LDM** *command description* **PROCESSING. RC=X'***return code***; IC=X'***information code***. UNABLE TO** *activity* **FILE DDNAME** *library ddname*, **FOR OVERLAY RESOURCE NAMED** *resource member name* *(transform type)*

Explanation: Revision of an overlay was requested, but the equivalent, original IBM overlay required for the conversion was not found in the IBM overlay library.

System response: Conversion to Xerox format was not directly affected by this error, except that the requested revision attempt will not be performed. Consequently, this may affect the final appearance of the printed document.

This message is followed by message XRD6301W, which provides more information.

User action: If the revision is required, check that the overlay is correctly identified as a revision. Make sure the equivalent IBM member exists in the appropriate IBM overlay library (as specified by the XOSF start-up proc) and is available for use by the transform type.

**XRD6309F** **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *command* **LDM** *command description* **PROCESSING. RC=X'***return code***; IC=X'***information code***. UNABLE TO** *activity* **FILE DDNAME** *library ddname*, **FOR OVERLAY RESOURCE NAMED** *resource member name* *(transform type)*

Explanation: This is usually an internal error. If there was an allocation error, the library specified by *library ddname* in the XOSF start-up proc could not be allocated using LDM.

System response: The overlay could not be converted to Xerox format. Document processing is terminated, and the document remains in the output queue.

User action: If there was an allocation error, verify that the library specified in the XOSF start-up proc exists. If the problem persists, call Xerox Technical Support.

**XRD6313E SEVERE ERROR ENCOUNTERED BY** *module name* **DURING THM command description PROCESSING. RC='return code'; IC=X'information code'. UNABLE TO** *activity thm insert item key*, **FOR OVERLAY RESOURCE NAMED** *resource member name (transform type)*

Explanation: This is an internal error.

System response: The conversion to Xerox format is not directly affected by this error. However, if a revision attempt is requested, the revision will not be performed.

User action: Call Xerox Technical Support.

**XRD6314F FATAL ERROR ENCOUNTERED BY** *module name* **DURING THM command description PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO** *activity thm insert item key*, **FOR OVERLAY TYPE RESOURCE NAMED** *resource member name (transform type)*

Explanation: This is an internal error.

System response: The overlay cannot be converted to Xerox format. Document processing is terminated. The document remains in the output queue.

User action: Call Xerox Technical Support.

**XRD6317E MINOR ERROR ENCOUNTERED BY** *module name* **DURING activity BUFFER STORAGE MANAGEMENT PROCESSING. RC=X'return code'; IC=X'information code'. UNABLE TO** *activity DATA BUFFER*, **FOR OVERLAY RESOURCE NAMED** *resource member name (transform type)*

Explanation: This is an internal error.

System response: The overlay conversion to Xerox format is not directly affected by this error.

User action: Call Xerox Technical Support.

**XRD6319F FATAL ERROR ENCOUNTERED BY** *module name* **DURING activity BUFFER STORAGE MANAGEMENT PROCESSING. RC=X'return code'; IC=X'buffer control block address'. UNABLE TO** *activity DATA BUFFER*, **FOR OVERLAY RESOURCE NAMED** *resource member name (transform type)*

Explanation: This is an internal error.

System response: The overlay cannot be converted to Xerox format. Document processing is terminated. The document remains in the output queue.

User action: Call Xerox Technical Support.

- XRD6320I**     **INFORMATION MESSAGE ISSUED BY** *module name* **DURING** *action* **LDM** *command description* **PROCESSING.** *status activity* **MEMBER NAMED** *member name* **FROM FILE DDNAME** *library ddname*, **FOR OVERLAY RESOURCE NAMED** *resource member name* *(transform type)*
- Explanation:     This message is issued when an invalid or redundant library member is successfully deleted. It provides an audit trail.
- System response:     The overlay conversion to Xerox format is not directly affected by this message.
- User action:     None required.
- 
- XRD6325I**     **INFORMATION MESSAGE ISSUED BY** *module name* **DURING** *THM command description* **PROCESSING.** *activity with* **ITEM KEY** *thm insert item key*, **FOR OVERLAY RESOURCE NAMED** *resource member name* *(transform type)*
- Explanation:     This message is issued when a new item is successfully added to the list of required revisions. It provides an audit trail.
- System response:     The overlay conversion to Xerox format is not directly affected by this message.
- User action:     None required.
- 
- XRD6329F**     **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *THM command description* **PROCESSING.** *thm insert* **ITEM KEY**, **FOR OVERLAY RESOURCE NAMED** *resource member name* *(transform type)*
- Explanation:     This is an internal error.
- System response:     The overlay cannot be converted to Xerox format. Document processing is terminated. The document remains in the output queue.
- User action:     Call Xerox Technical Support
- 
- XRD6331W**     **WARNING MESSAGE ISSUED BY** *module name* **DURING** *resource library member* **PROCESSING.** **TEXT MEMBER NAME** *text sequence number* **NOT** *value.* *action*, **FOR OVERLAY RESOURCE NAMED** *resource member name* *(transform type)*
- Explanation:     This is an internal error.
- System response:     The conversion to Xerox format is not directly affected by this error.
- User action:     None required.
- 
- XRD6334F**     **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *resource library member* **PROCESSING.** **TEXT MEMBER NAME** *member name* **NOT** *value.* *action*, **FOR OVERLAY RESOURCE NAMED** *resource member name* *(transform type)*
- Explanation:     This is an internal error.
- System response:     The overlay cannot be converted to Xerox format. Document processing is terminated. The document remains in the output queue.
- User action:     Call Xerox Technical Support.

**XRD6336W**    **WARNING MESSAGE ISSUED BY** *module name* **DURING** *resource library member* **PROCESSING.** *expected item BUT actual item FOUND.* *activity*, **FOR OVERLAY RESOURCE NAMED** *resource member name (transform type)*

Explanation:    This is an internal error.

System response:    The conversion to Xerox format is not directly affected by this error.

User action:    None required.

**XRD6339F**    **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *resource library member* **PROCESSING.** *expected item BUT actual item FOUND.* *activity*, **FOR OVERLAY RESOURCE NAMED** *resource member name (transform type)*

Explanation:    This is an internal error.

System response:    The overlay cannot be converted to Xerox format. Document processing is terminated. The document remains in the output queue.

User action:    Call Xerox Technical Support.

**XRD6354F**    **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *activity* **PROCESSING BY** *conversion program.* **RC=X'***return code***;** **IC=X'***return code***.** *action/reason*, **FOR type RESOURCE NAMED** *resource name (transform type)*

Explanation:    For XRDOVLAY, the specified conversion program encountered a fatal problem while attempting to convert an IBM overlay to the specified format. For XRDIMG, this is an internal error related to the processing of shading information within an image.

System response:    Document processing is terminated. The document remains in the output queue.

User action:    To help diagnose and resolve the problem, the guidelines are:

- For XRDOVLAY, investigate any messages logged by XAM or XAU modules or any other messages issued by XRDOVLAY, XRDIMG, or XRDPSG. If the problem persists, call Xerox Technical Support.
- For XRDIMG, call Xerox Technical Support.

**XRD6393W**    **WARNING MESSAGE ISSUED BY** *module name* **DURING** *type of* **PROCESSING, DUE TO**  
*reason. result*

Explanation:    This message is issued as a result of one of these conditions:

- The data stream contains images that have different resolutions within the same resource.
- A begin image/end image sequence is detected but no image raster data is found.

System response:    For images having different resolutions, image processing continues. The resolution of the first image encountered within the resource is used for all other images in that resource.

For begin image/end image sequences, images are ignored and processing continues.

User action:    For images having different resolutions, change the individual images in the resource to the same resolution and resubmit the job.

For begin image/end image sequences, verify that the resource specified is correct and resubmit the job.

**XRD6417F**    **RESOURCE** *resource member name*, **TYPE** *resource type* **FAILED EXIT 6**  
**AUTHORIZATION**

Explanation:    The current user exit 06 has instructed XPAF not to allow the user to access this particular resource.

System response:    The current print job is aborted.

User action:    Contact your systems programmer for information on the operation of user exit 06 at your site.

## XRF messages

---

### **XRF0106F      XRFCNVF LOAD OF *load module* FAILED**

Explanation:      The image cannot be converted from 240 dpi to 300 dpi. *Load module* can be either XRFTAB01, XRFAB02, XRFTAB03, or XRFTABED.

System response:      Error recovery and/or further processing by XPAF is determined at a higher level.

User action:      Call Xerox Technical Support.

### **XRF0305E      COULD NOT *activity* TABLE *table name operation*. THM RC=X'*return code*'**

Explanation:      An attempt to process the named table failed. *Operation* identifies that the type of processing that was being performed when the error occurred.

System response:      Processing continues.

User action:      Examine your font table library to determine if the named table is in error. Verify that the job output is valid. If not, resubmit the job.

### **XRF0724E      LDM ENCOUNTERED AN ERROR TRYING TO *operation***

Explanation:      This is an internal error.

System response:      Document processing is terminated. The document remains in the output queue.

User action:      Call Xerox Technical Support.

### **XRF2124E      ERROR *reading* LIBRARY *library ddname library dataset name*. LDM RC=X'*return code*'; IC=X'*information code*'**

Explanation:      You may have AFP resource libraries with different block sizes concatenated in the XOSF start-up proc.

System response:      Document processing is terminated. The document remains in the output queue.

User action:      Complete these steps:

- Ensure that all DCB attributes of all datasets named on the DD statement for the AFP resource library are compatible. If necessary, copy the required AFP resource(s) into a library with the correct DCB attributes.
- Ensure that the dataset concatenation follows the rules for concatenation of datasets within your JES system.

If the problem persists, call Xerox Technical Support.

**XRF2125W**     *program name* **ENCOUNTERED** *image type image name* **THAT OVERRAN ITS ASSIGNED RUN LENGTH ARRAY**

- Explanation:     When processing IOCA images or when using the IMAGEPROC=2 printer profile parameter setting, the image storage was exceeded. Because of the complexity of the named image, the run length array size was overrun.
- System response:     Document processing continues. Only the portion of the image that is in the array is printed.
- User action:     Review the output for the named image to determine if it is acceptable.

**XRF2133E**     **INVALID STRUCTURED FIELD ID X'*structured field hex identifier*' FOUND. PROCESSING *structured field***

- Explanation:     A document or PAGEDEF resource contained an invalid structured field (SF). The invalid SF was in a place where the program expected to process a map coded font or page descriptor type of a structured field within the current active environmental group block.
- System response:     The invalid SF is ignored, but document or PAGEDEF processing continues.
- User action:     Check the type and sequence of SFs within the active environmental group block. If the problem persists, call Xerox Technical Support.

**XRF3010F**     **COULD NOT GET X'*storage size*' BYTES OF MEMORY *activity***

- Explanation:     Insufficient storage was available for a particular image conversion function. *Storage size* identifies the amount of memory requested. *Activity* names the particular data structure, control block, or data storage buffer for which the memory allocation request failed.
- System response:     The input image cannot be converted to Xerox format. Document processing is terminated, and the document remains in the output queue.
- User action:     Increase the region size for the printer proc or rerun the job. If the problem persists, call Xerox Technical Support.

**XRF3011E**     **COULD NOT RELEASE X'*storage size*' BYTES OF MEMORY FROM LOCATION X'*storage address*' *activity***

- Explanation:     Storage could not be freed for a particular image conversion function. *Storage size* identifies the amount of memory involved. *Storage address* identifies the location of that memory. *Activity* names the particular data structure, control block, or data storage buffer for which the memory release request failed.
- System response:     The input image conversion to Xerox format is not directly affected by this error. However, if additional errors occur, document processing may be terminated, in which case the document remains in the output queue.
- User action:     Reprint the document or resubmit the batch job. If the problem persists, call Xerox Technical Support.

**XRF3015E** **COULD NOT** *command* **LIBRARY** *library dsname activity*. **LDM RC=X'***return code'*

Explanation: XPAF could not perform the named activity on the specified library.

System response: Document processing is terminated. The document remains in the output queue.

User action: Ensure the library exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XRF3016E** **COULD NOT** *command* **MEMBER** *member name* **OF LIBRARY** *library ddname resource type library*. **LDM RC=X'***return code'*

Explanation: XPAF could not perform the named command on the specified member.

System response: Document processing is terminated. The document remains in the output queue.

User action: Ensure the member exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XRF3017E** **COULD NOT** *command* **LCA FOR** *type library*. **LDM RC=X'***return code'*

Explanation: This is an internal error.

System response: Document processing is terminated. The document remains in the output queue.

User action: Call Xerox Technical Support.

**XRF3018E** **COULD NOT ACQUIRE TCB** *activity*. **THM RC=X'***return code'*

Explanation: This is an internal error.

System response: Document processing is terminated. The document remains in the output queue.

User action: Call Xerox Technical Support.

**XRF4002E** *module name* **DETECTED AN INVALID LINE CONTROL CODE X'***value'* **AT IMAGE OFFSET X'***value'*

Explanation: During image decompression, an invalid compression mode was detected. Each scan line of an image begins with a line control code (LCC) that designates which compression mode will be used. The following compression modes are the only valid values that can be used: RAW=X'00', LIN=X'01', ENC=X'02', or HTN=X'03'.

System response: Image decompression is terminated. This message is followed by another message which provides more information.

User action: Refer to the user action of the message that follows this one for more information.

**XRF4004F**     *module name* **DETECTED AN INVALID** *control block name* **CONTROL BLOCK AT LOCATION X'***storage address'*

- Explanation:     The named module determined that the named control block required for image conversion was not valid.
- System response:     The input image cannot be converted to Xerox format. Document processing is terminated, and the document remains in the output queue.
- User action:     A critical portion of the XPAF code is back-leveled, or recent program maintenance has been installed incorrectly. Call Xerox Technical Support.

**XRF4005E**     **THM ERROR DURING** *command* **FOR** *table type*, **ITEM KEY** *item key*. **THM IC=X'***information code'*; **RC=X'***return code'*

- Explanation:     While processing a page-formatted document that uses Xerox fonts, XOSF was unable to find the necessary entries in either the XPAFE2A or XPAFEFW table.
- System response:     Document processing is terminated. The document remains in the output queue.
- User action:     Use the XOAF Update Xerox Font Characteristics Information option on the Xerox Page Format Editor menu or the CONVERT FONT TSO/batch command to generate the necessary font table entries. For information about using these options, refer to [Section Eight: Xerox Page Format Editor User Guide](#).

**XRF4006E**     **COULD NOT FIND** *type* **TABLE**. **THM IC=X'***information code'*; **RC=X'***return code'*

- Explanation:     While processing an MCF structured field within an active environmental group, a required table containing important font information could not be found in the appropriate library.
- System response:     Document processing is terminated. The document remains in the output queue.
- User action:     Verify that the specified font table exists in the font table library defined in the XOSF start-up proc. If the problem persists, call Xerox Technical Support.

**XRF4008E**     **NO XEROX REPLICA FONTS FOUND FOR IBM CHARACTER SET** *character set name*

- Explanation:     The document contains a request for an IBM character set that XPAF does not support.
- System response:     Document processing is terminated. The document remains in the output queue.
- User action:     Make sure the specified IBM character set name is valid. If the problem persists, call Xerox Technical Support.

**XRF4328F      ERROR DETECTED PROCESSING FORMDEF *formdef name* IN *document part***

Explanation:    The resource processor detected an error in the input data stream while trying to convert an IBM FORMDEF resource. The FORMDEF member name is displayed without its F1 prefix. The *document part* is either DOCUMENT, AFPJOBHDR, AFPJOBTLR, AFPMSGDS, or AFPDSHDR, referring to either the document itself or one of the AFP banner types.

System response:    Document processing is terminated.

User action:        Verify the named FORMDEF and correct any errors present. Refresh the FDEFLIB PDS in XPAF and rerun the job. If the problem persists, call Xerox Technical Support.

**XRF6209E      INVALID FUNCTION *function type* PASSED TO BUFFER MANAGER**

Explanation:    This is an internal error.

System response:    Document processing is terminated. The document remains in the output queue.

User action:        Call Xerox Technical Support.

**XRF6228E      PROCESSING *document processing* GROUP BUT NO STORAGE ALLOCATED**

Explanation:    This is an internal error.

System response:    Document processing is terminated.

User action:        Call Xerox Technical Support.

**XRF6234E      GET REQUESTED FOR EMPTY BUFFER**

Explanation:    This is an internal error.

System response:    Document processing is terminated.

User action:        Call Xerox Technical Support.

**XRF6235E      GET REQUESTED BEYOND END OF BUFFER**

Explanation:    This is an internal error.

System response:    Document processing is terminated.

User action:        Call Xerox Technical Support.

**XRF623AE    UNABLE TO CREATE** *type font widths* **FOR CODE PAGE** *code page name* **CHARACTER SET** *character set name*

- Explanation: While processing an MCF structured field within an active environmental group, an IBM font was referenced. However, no entry for that font exists in the appropriate font widths table, and an entry in the specified table could not be built.
- System response: Document processing is terminated. The document remains in the output queue.
- User action: Verify that the specified font code page name and character set name exist in the correct font library defined in the XOSF start-up proc. If the problem persists, call Xerox Technical Support.

**XRF623BE    COULD NOT FIND CODED FONT** *coded font name* **IN IBM FONT LIBRARY**

- Explanation: XPAF could not find the specified coded font name in the IBM font library.
- System response: Document processing is terminated.
- User action: Make sure the specified coded font is contained in the IBM font library named on the IBMFONT DD statement in the XOSF start-up proc.
- Correct the font problem and rerun the job. If the problem persists, call Xerox Technical Support.

**XRF623DE    FONT** *name* **NOT IN FONT INFORMATION TABLE. UNABLE TO PROCESS DOCUMENT**

- Explanation: The named font was specified in a page format; however, the font was not found in the XPAFXFI table.
- System response: Document processing is terminated.
- User action: Add an entry for the font in the XPAFXFI table, then resubmit the document.

**XRF6255F FATAL ERROR ENCOUNTERED BY *module name*. *data type* NOT SUPPORTED**

- Explanation: XPAF's current IOCA support does not include support for Band Image Data, Numbered Image Data, the named data compression algorithm, or image orientations other than (0, 90).
- System response: XPAF rejects IOCA images that contain Band Image Data, Numbered Image Data, the named data compression algorithm, or image orientations other than (0, 90). Document processing terminates. Whether XPAF recovers from this error or performs further processing is determined at a higher level.
- User action: Identify IOCA images that include Band Image Data (banded images), Numbered Image Data (tiled images), the named data compression algorithm, or image orientations other than (0, 90). Then choose one of these alternatives:
- Remove the images from the document data stream.
  - Regenerate the images in a form supported by XPAF. For information about XPAF-supported IOCA images, refer to [Section Four: Printing Documents with XPAF](#).
- After removing or regenerating the IOCA images in question, rerun the print job. If the problem persists, call Xerox Technical Support.

**XRF6256E SEVERE ERROR ENCOUNTERED BY *module*. *reason***

- Explanation: This is an internal error.
- Module* is one of these items:
- XRFCCITT
  - XRFMMR
- Reason* is one of these conditions:
- Invalid decompression code
  - Negative run length
- System response: Document processing is terminated.
- User action: Call Xerox Technical Support.

**XRF6263F FATAL ERROR ENCOUNTERED BY *module name* DURING *command* BUFFER STORAGE MANAGEMENT PROCESSING *activity* DATA RECORDS. RC=X'*return code*'; IC=X'*information code*'**

- Explanation: This is an internal error.
- System response: The image cannot be converted to .IMG format.
- User action: Call Xerox Technical Support.

**XRF6269E MINOR ERROR ENCOUNTERED BY *module name* DURING COMPRESSION PROCESSING OF IMAGE NAMED *image member name*. REMAINDER OF IMAGE ROW NUMBER X'*image row number*' ASSUMED TO BE WHITE SPACE**

Explanation: This is an internal error.

System response: The image conversion to .IMG format is not adversely affected by this error, unless this error occurs throughout the image. Further XPAF processing is determined at a higher level.

User action: Call Xerox Technical Support.

**XRF6354F FATAL ERROR ENCOUNTERED BY XRFILAFP DURING IMAGE FAST PATH CREATION PROCESSING BY XRFILAFP. RC=X'*return code*'; IC=X'*information code*'. DUE TO AN INEXPLICABLE INTERNAL LOGIC FAILURE, FOR IMAGE PAGE RESOURCE NAMED *INLINE (M)***

Explanation: An error was detected within the internal control block structure of XPAF during AFP image processing.

System response: The current image cannot be converted to Xerox format and processing is terminated for the current document.

User action: Gather all materials related to the error and call Xerox Technical Support.

**XRF6355E INVALID BUFFER CONTROL BLOCK**

Explanation: This is an internal error.

System response: XPAF stops printing the current document and returns the document to JES to hold. Printing continues with the next document.

User action: Check the previous messages to determine the cause of this error and take the action specified for the first error message. If no other messages are present or if the condition persists, call Xerox Technical Support.

**XRF6395F FATAL ERROR ENCOUNTERED BY *module name* DURING *parameter validation* PROCESSING, (*problem description*)**

Explanation: The JCL parameter field contains one or more keywords that either have an incorrect name length or are not valid keywords.

System response: The IBM library cannot be preconverted to .IMG format. Overlay and page segment processing is terminated.

User action: Correct the JCL parameter keyword error and then resubmit the job. If the problem persists, call Xerox Technical Support.

**XRF6396E MINOR ERROR ENCOUNTERED BY *module name* DURING *activity* PROCESSING, (*failure explanation*). REFER TO ANY PREVIOUS MESSAGES FOR MORE INFORMATION**

Explanation: This is an internal error.

System response: This error does not directly affect preconversion of the IBM library to .IMG format. Overlay and page segment processing is already complete. Storage corruption may have occurred.

User action: Preceding messages may help explain the cause of the problem. Call Xerox Technical Support.

**XRF6397F**     **FATAL ERROR ENCOUNTERED BY** *module name* **DURING** *activity* **PROCESSING,** (*failure explanation*). **REFER TO ANY PREVIOUS MESSAGES FOR MORE INFORMATION**

Explanation:     This is an internal error.

System response:     The IBM library cannot be preconverted to .IMG format. Overlay and page segment processing is terminated.

User action:     Preceding messages may help explain the cause of the problem. Call Xerox Technical Support.

**XRF6398I**     **THE VALUE OF KEYWORD** *keyword* **IS:** *data value*; **IF INCORRECT, CHECK THE JCL PARM=STATEMENT**

Explanation:     This message identifies the named keyword parameter value being used for this execution of XRFBATCH.

System response:     None.

User action:     If the *data value* for the named keyword is correct, no action is needed. If the *data value* for the named keyword is unexpected or incorrect, check the syntax and validity of the named parameter value. Correct any errors and resubmit the job. If the problem persists, call Xerox Technical Support.

**XRF6399E**     **SEVERE ERROR ENCOUNTERED BY** *module name* **DURING** *activity* **PROCESSING OF** *type* **RESOURCE NAMED** *resource name*. **RC=X**'*return code*'; **IC=X**'*information code*'

Explanation:     This message is issued as a result of a non-zero return code from XRFPSeg or XRFOVLAY. Preceding messages may explain the cause of the problem.

System response:     The page segment or overlay identified by *resource name* cannot be converted. Processing of other resources continues.

User action:     Examine the log for additional information about the error, and take any action indicated. Resubmit the job. If the problem persists, call Xerox Technical Support.

**XRF6400I**     **IBM** *image type* **RESOURCE NAMED** *ibm resource name* **CONVERTED SUCCESSFULLY TO A XEROX RESOURCE FILE**

Explanation:     This message identifies the IBM resource that has been successfully converted to a Xerox resource file through XRFBATCH.

System response:     Processing continues.

User action:     None required. You may review the output from XRFBATCH for a list of all converted page segments.

**XRF6411I IBM AFP RESOURCE MEMBER NAMED *resource member name* NOT CONVERTED TO A XEROX RESOURCE DUE TO *reason*.**

- Explanation: The resource was determined not to be a page segment, the member started with the letter O, or you attempted to convert a page segment to a decentralized native image which is not supported.
- System response: The named resource is not converted. XPAF issues this message for each member in the partitioned dataset that is not converted. Processing of other resources continues.
- User action: If the named resource is a page segment, rename it so that it does not start with the letter O. Then, resubmit the job. If you attempted to convert a page segment to a native decentralized image see XRFBATCH discussion in [Section Three: Managing Resources with XPAF](#).

**XRF6415F FATAL ERROR ENCOUNTERED BY *module name* DURING *activity description* PROCESSING (*problem description*)**

- Explanation: A single member was specified in the INFILE DD statement. XRFBATCH supports PDS and VSAM processing, but not sequential processing.
- System response: The IBM library cannot be preconverted to .IMG format. Overlay and page segment processing is terminated.
- User action: Put the single member in a PDS, specify that PDS in the INFILE DD statement, and rerun the job.

**XRF6417F RESOURCE *resource member name* TYPE *resource type* FAILED EXIT 6 AUTHORIZATION**

- Explanation: The current user exit 06 has instructed XPAF not to allow the user to access this particular resource.
- System response: The current print job is aborted.
- User action: Contact your systems programmer for information on the operation of user exit 06 at your site.

**XRF6418E CODE PAGE *code page name* IS NOT ASSOCIATED WITH ANY KNOWN FONT FAMILY COMPLEMENT VALUE. CHARACTER SET *character set name* CANNOT BE ADJUSTED**

- Explanation: The job sent to the printer contained an MCF-2 structured field record that specified a global resource identifier (GRID) value. The specified code page value in the GRID was not found in the internal XPAF font family complement table; this complement value is required to complete the name of the character set. Since XPAF cannot determine the exact name of the character set from the values specified in the GRID, the font structure cannot be built.
- System response: Document processing is terminated, and the document remains held in the output queue.
- User action: Either recreate the input data and generate another GRID value that will call for a code page name that coordinates with a valid font family complement identifier value. Or, update the CPGID table for the GRID value specified in the data stream. Then resubmit the job. The new entry must associate the GRID value with a code page name that coordinates with a valid font family complement identifier value.

**XRF6419E    UNABLE TO FIND *resource type* ENTRY IN THE *resource type* TABLE FOR THE GRID VALUE *global resource identifier value***

- Explanation: During the processing of an MCF-2 structured field, the font global identifier or the code page global identifier value could not be found in the appropriate table for the specified global resource identifier (GRID) value.
- System response: Document processing is terminated, and the document remains held in the output queue.
- User action: Update the CPGID or FGID table to contain an entry for the specified GRID value and resubmit the job.

**XRF6420E    UNDEFINED TRIPLET ID FOUND. UNABLE TO PROCESS TRIPLET ID *triplet id***

- Explanation: During the processing of an MCF-2 structured field, an invalid triplet identifier was found.
- System response: Document processing is terminated, and the document remains held in the output queue.
- User action: Recreate the input data, ensuring that the MCF-2 structured field contains only valid triplets and resubmit the job.

**XRF6423I    DYNAMIC FONT WIDTHS BUILT**

- Explanation: A font has been requested for which no IBM font width entry was found. A temporary entry has been created
- System response: The system dynamically creates an entry, printer processing continues.
- User action: The IBM font library convert batch utility should be run to create a permanent IFW table entry.

**XRF6424W    MCF TRIPLET ID *id number* FOR CODE PAGE *code page* CHARACTER SET *character set* BYPASSED**

- Explanation: A map coded font, font resolution metric triplet, was encountered. Mixed font resolution positioning is not supported by XPAF.
- System response: Printing continues if the font exists for the current document font resolution.
- User action: Verify that the output is correct. If not, the fonts with this triplet must be replaced. Message XRF6425W has been added.

**XRF6425W    DATAMAP *data map name* UNSUPPORTED TRIPLET ID *id name* BYPASSED.**

- Explanation: An unsupported triplet id was detected for the data map when line descriptors were processed.
- System response: Processing continues and the triplet is ignored.
- User action: Verify that the output is correct, or remove the triplets from the data map.

## XSJ messages

---

### **XSJ0090E**    *level* **z/OS LEVEL UNSUPPORTED**

- Explanation:    XOSF detected a level of z/OS that does not have a corresponding support module.
- System response:    XOSF processing continues, but XPAF extended JCL keywords are ignored.
- User action:    Call Xerox Technical Support with the z/OS level from the message. For the minimum z/OS/JES levels currently supported by XPAF, refer to [Section Two: Installing and Customizing XPAF](#).

### **XSJ7202E**    **COULD NOT GET SUFFICIENT MEMORY** *action*

- Explanation:    There was insufficient virtual storage available to hold all the XPAF extended JCL keywords.
- System response:    XOSF processing continues, but XPAF extended JCL keywords are ignored.
- User action:    Stop XOSF. Perform one of these options:
- Increase the region parameter on the XOSF start-up proc.
  - Increase the XCORE initialization parameter value.
- Restart XOSF.

### **XSJ7205E**    **INTERNAL TABLE OVERFLOW FOR SJF LIST; XJCL WILL NOT BE HONORED**

- Explanation:    An internal table overflow condition occurred during XOSF initialization.
- System response:    XOSF processing continues, but XPAF extended JCL keywords are ignored.
- User action:    Call Xerox Technical Support.

## XSL messages

---

### **XSL0001I**      *message text*

Explanation: This message provides supplemental information to assist in debugging. It is issued only if intensive logging is turned on.

System response: Processing continues.

User action: None required.

### **XSL0002I**      *message text*

Explanation: This message provides supplemental information to assist in debugging. It is issued only if intensive logging is turned on.

System response: Processing continues.

User action: None required.

### **XSL0203E**      **THM ERROR IN MODULE** *module name*. **CMD=***command*; **IC=X'***thm-information code***'**; **RC=X'***thm-return code***'**

Explanation: While attempting to process an XPAF VSAM dataset, an unexpected error was encountered. Other messages are usually issued along with this message to further identify the operation that failed.

System response: The current operation is terminated.

User action: Verify that all of the required XPAF libraries are present and not corrupted. If you believe you are receiving this message in error, call Xerox Technical Support.

### **XSL3413E**      **OPEN FOR DSNAME** *dataset name* **FAILED**

Explanation: Using the FCB and/or UCS initialization or printer profile parameters, you requested that XOSF download FCBs and/or UCSs to a centralized printer. However, open processing on behalf of that request failed. XOSF was unable to allocate SYS1.IMAGELIB.

System response: Document processing continues. The FCB and/or UCS download request is ignored.

User action: Verify that SYS1.IMAGELIB is available on your z/OS system, then resubmit the job.

**XSL3441W    fcb name FCB TYPE NOT SUPPORTED**

- Explanation:    The FCB you specified using the FCB and FCBPREF initialization parameters resulted in a non-3211 type FCB being loaded from SYS1.IMAGELIB.
- System response:    The system defaults to FCB2STD2 and continues processing. If the printer JSL specifies FCB=PROCESS, SMF accounting will be based on the default FCB.
- User action:    Create a 3211-type FCB in SYS1.IMAGELIB, then resubmit the job.

**XSL3585W    nn DAYS LEFT IN GRACE PERIOD**

- Explanation:    The expiration date has passed for the product. A grace period has been entered and there are nn days left in the grace period before the product will cease to function. This message will be displayed at the start of every print job.
- System response:    The product will continue to function normally.
- User action:    Contact Xerox for a new License String to extend the license period.

**XSL3586E    nn-DAY GRACE PERIOD HAS EXPIRED!**

- Explanation:    The expiration date has passed for the product. The extended grace period has also expired.
- System response:    The product will cease to function.
- User action:    Contact Xerox for a new License String to extend the license period.

**XSL3589W    \*\*\* WARNING \*\*\* WARNING \*\*\* WARNING \*\*\* WARNING \*\*\***

- Explanation:    This message is issued in conjunction with message XSL3591I (\*\* WARNING \*\*\* XPAF LICENSE WILL EXPIRE IN nn DAYS.)
- System response:    Processing continues.
- User action:    Contact Xerox in order to renew the license string.

**XSL3591I    \*\*\* WARNING \*\*\* *product* LICENSE WILL EXPIRE IN *number* DAYS! \*\*\***

- Explanation:    While processing a print document, it was determined that the *product* expiration date is within sixty days of the current date. This message is an informational message only.
- System response:    Processing continues.
- User action:    Contact Xerox in order to renew the license string.

**XSL3592E \*\*\* *product* LICENSE HAS EXPIRED! \*\*\***

Explanation: While processing a print document, it was determined that the expiration date of the *product* has expired.

System response: Processing is terminated and the XOSF address space will be shut down.

User action: Contact Xerox in order to renew the license string.

**XSL4000E VIPP DOCUMENT TYPE MUST BE NM FOR A VIPP DEVICE**

Explanation: The document is being sent to a VIPP-enabled device, or PRMODE=VIPP has been specified in the document, and the document is not a native mode (line-mode) document. VIPP documents must be line-mode data streams that have VIPP commands inserted at the beginning of the application.

System response: XPAF issues a secondary message (XSL4001I) showing the current document type being processed. The document is then aborted and requeued to JES.

User action: Redirect the document to an XPAF printer that supports the document type indicated in message XSL4001I.

**XSL4001I CURRENT DOCUMENT TYPE= *document type*, PRMODE= *prmode*, DEVICE= *device type***

Explanation: This is an informational message that displays the current document processing options. It is displayed following message XSL4000E.

System response: The document is aborted and requeued to JES.

User action: Redirect the document to an XPAF printer that supports the named document type.

**XSL7201E ESTAE FAILURE ON ENTRY TO *module name*. RC=X'*return code*'; IC=X'*information code*'**

Explanation: This is an internal error.

System response: The printer task is terminated.

User action: Call Xerox Technical Support.

**XSL7202E COULD NOT GET SUFFICIENT MEMORY *activity***

Explanation: A get memory request failed.

System response: Document processing is terminated.

User action: Increase the region size.

**XSL7203E      MODULE *module name* HAS AN ANCHOR ADDRESS OF ZERO (IS NOT LOADED IN MEMORY)**

Explanation:      The named module was not loaded into memory.  
 System response:    The printer task is terminated.  
 User action:        Verify that the named module is in the XPAF load library. If it is present and the problem persists, call Xerox Technical Support.

**XSL7204E      *parameter* IGNORED. IMAGE *image name* NOT FOUND IN SYS1.IMAGELIB**

Explanation:      During FCB or UCS processing, the named FCB or UCS image (FCB2xxxx or UCS2xxxx) was not found in SYS1.IMAGELIB.  
 System response:    Processing continues. The FCB or UCS is not downloaded to the printer.  
 User action:        Correct the FCB or UCS parameter in the job or create the named FCB or UCS in SYS1.IMAGELIB. Then resubmit the job.

**XSL7206E      PPD INITIALIZATION FAILED. RC=X'*return code*'**

Explanation:      The PPD was unable to initialize the printer. Additional messages issued from the PPD indicate the exact cause of the error. The printer may be allocated to another user, or the printer profile may be incorrect.  
 System response:    The printer task is terminated.  
 User action:        Correct the error and try again.

**XSL7209I      *component* PIPELINE ERROR: *description***

Explanation:      An error in the named component yielded one or more non-zero return codes.  
 System response:    System response depends on the most severe return code encountered, which is the code displayed in this message. Message XSL720BI describes the result of the pipeline error.  
 User action:        If possible, correct the error and rerun the job. If you cannot correct the error, call Xerox Technical Support.

**XSL720AE      UNEXPECTED RC OF X'*return code*' FROM MODULE *module name* activity**

Explanation:      This is an internal error.  
 System response:    The document or printer task is terminated.  
 User action:        Call Xerox Technical Support.

**XSL720BI PIPELINE ERROR RESULTED IN: *description***

- Explanation: A call to the process control module returned one or more non-zero return codes. The most severe return code is displayed in message XSL7209I and yields the result described in this message.
- System response: The *description* portion of the message explains the result of the pipeline error and corresponds to the return code *displayed* in message XSL7209I. For example, the *description* may be "ABORT DOCUMENT IMMEDIATELY."
- User action: If possible, correct the error and rerun the job. If you cannot correct the error, call Xerox Technical Support.

**XSL720CI MODULE *module name* RETURNED NON-ZERO RC=X' *return code*'**

- Explanation: This is an internal error.
- System response: The printer task is terminated.
- User action: Call Xerox Technical Support.

**XSL720DE MODULE *module name* CALLED WITHOUT A PRIOR INITIALIZATION CALL**

- Explanation: This is an internal error.
- System response: The printer task is terminated.
- User action: Call Xerox Technical Support.

**XSL720EI**     *job number job name* **PRINTING** *activity*

Explanation: One of two conditions exists:

- The operator entered a JES command (RESTART, INTERRUPT, CANCEL, FORWARD SPACE, or BACKSPACE).
- XPAF encountered a condition that does not allow it to continue document processing. Document processing is terminated.

*Activity* can be one of these conditions:

- Restarted by operator
- Interrupted by operator
- Canceled by operator
- Aborted by XPAF
- Forward spaced by operator
- Backspaced by operator

System response: One of six conditions exists (corresponding to the six *activity* types):

- The document is restarted at the beginning of the restarted dataset.
- The document is placed on the active printer class and restarts at the last known JES checkpoint taken upon reselection.
- The document is purged from the JES spool; XPAF cancels document printing.
- The document printing process is terminated by XOSF.
- The document is forward spaced a specified number of pages.
- The document is backspaced a specified number of pages.

User action: None required.

**XSL720FI**     *printer name* **WAITING FOR WORK**

Explanation: No more datasets are available for printing. XOSF has caught up with all available work for the printer.

System response: The printer task remains active and available for further processing.

User action: None required.

## XSV messages

---

### **XSV9801E    INVALID PARAMETER SPECIFIED FOR XSVCUPDT**

Explanation:    The parameter supplied to the batch SVC table update utility is not valid.  
 System response:    Processing is terminated.  
 User action:    Check the format of the parameter, the SVC number, and the operation requested. Then retry the operation.

### **XSV9802E    SVC MODULE *module name* NOT FOUND IN LINK PACK AREA**

Explanation:    While trying to add an SVC table entry, the named module was not found in the link pack area.  
 System response:    Processing is terminated.  
 User action:    Add the SVC module to the link pack area and retry the operation.

### **XSV9803I    SVC TABLE *operation* SUCCESSFUL FOR SVC *entry***

Explanation:    The named SVC table entry was successfully replaced in or deleted from the SVC table.  
 System response:    None.  
 User action:    None.

### **XSV9804E    SVC TABLE *operation* FAILED FOR SVC *entry***

Explanation:    The named SVC table entry was not successfully replaced in or deleted from the SVC table.  
 System response:    Processing is terminated.  
 User action:    Call Xerox Technical Support.

## XTB messages

---

### XTB0001I NO PPT PRESENT. CANNOT INIT/TERM TABLES

Explanation: This is an internal error.  
 System response: The printer task is terminated.  
 User action: Call Xerox Technical Support.

### XTB0221E *option* **FAILED. TABLE** *table name* **NOT FOUND IN DDNAME** *table library ddname*

Explanation: The failed option was attempted for the specified table, but the table name could not be found in the dataset associated with the specified ddname.  
 System response: Document processing is terminated. The document is requeued to hold status.  
 User action: Correct the table name or the ddname, then resubmit the job.

### XTB3614E *printer: INVALID PPT VALUE (value) FOR parameter. action*

Explanation: An invalid value was entered for the specified parameter in the named printer profile.  
 System response: The *action* indicates whether the printer profile is built. Most invalid values are ignored; however, some result in a "Cannot build PPT" action.  
 User action: All errors must be corrected. Edit the printer profile and correct the invalid value.

### XTB6227I **ERROR PROCESSING** *thm command. PROCESSING table*

OR

### **ERROR PROCESSING** *ldm command. PROCESSING ddname*

Explanation: An error occurred while attempting to initialize printer tables or libraries. The error occurred while processing the identified command on the specified table or DD name. This message will be preceded by additional messages from THM or LDM that identify the exact cause of the problem.  
 System response: Printer initialization is terminated. The printer cannot be started.  
 User action: Correct the problem identified by the THM or LDM messages, then restart the printer.

### XTB7202E **COULD NOT GET SUFFICIENT MEMORY** *activity*

Explanation: A get memory request failed.  
 System response: Document processing is terminated.  
 User action: Increase the region size.

**XTB7501E**     *ppd directory ERROR. EC=X'error code'*

Explanation:     An error occurred while attempting to retrieve the directory lists from a printer running under HIP (the printer profile specifies XNS=YES). EC is the return code returned from the printer during the directory retrieval. This error usually results from an incorrect software level on the printer.

System response:     Printer initialization is terminated. The printer cannot be started.

User action:     Correct the problem at the printer or run without HIP (specify XNS=NO in the printer profile). Once the problem is corrected, restart the printer.

## XTC messages

---

### **XTC0001I**     *message text*

Explanation:     *Message text* consists of a message produced by another component. Refer to the chapter of the specified component for an explanation of this message.

System response:     Refer to the documentation for the specified component.

User action:     Refer to the documentation for the specified component.

### **XTC2116E**     **UNABLE TO ALLOCATE DSNAME** *native library*. **DYNAMIC ALLOCATION RC=X'return code'**

Explanation:     The XPAF TCP/IP interface failed to dynamically allocate the dataset.

System response:     Processing is terminated.

User action:     Check the return code in the appropriate z/OS publication on system macros and facilities.

### **XTC4021E**     **RECORD IS TOO BIG FOR THE TCP BUFFER. INCREASE TCPBUFSIZE TO AT LEAST n**

Explanation:     An attempt was made to send a record via the TCPIP interface that is longer than the TCPIP buffer size specified by TCPBUFSIZE. The record would not fit into the buffer.

System response:     The document is aborted and held in the output queue.

User action:     Increase the value specified in the printer profile for TCPBUFSIZE to at least the value specified by 'n' in the message.

### **XTC414FE**     *member name* **BUFFER CAPACITY EXCEEDED.**

Explanation:     When processing a member from the LPRDSN for variable substitution, the amount of data that can be contained in the variable substitution area buffer has been exceeded.

System response:     The variable substitution process is terminated and the amount of data processed so far is returned to the higher level program for processing. Unexpected results may occur.

User action:     IContact Xerox Technical support.

**XTC4153E MEMBER *member name* NOT FOUND IN LIBRARY *library name***

- Explanation: Your document has been processed and saved to a dataset. However, the batch job that sends the dataset to a printer using the TCP/LPR or TCP/IP protocols was not submitted because the named member was not found in the named library.
- System response: Processing of the document has completed, but the batch job could not be submitted. The document is not requeued.
- User action: Verify that the required JCL member exists in the named library and is correctly specified in the LPRJCL printer profile parameter to ensure that the batch job will run the next time you print your document.
- Refer to [Section Two: Installing and Customizing XPAF](#) for instructions on how to set up your system for TCP batch printing. Refer to [Section Five: XPAF Parameter and Keyword Reference](#) for more information about TCP-related printer profile parameters.

**XTC7750I LPR JCL CREATED USING MEMBER *member name* FROM *library name***

- Explanation: The named member in the named library has been processed, and the batch job that sends your document to a printer using the TCP/LPR or TCP/IP protocols was submitted.
- System response: XPAF processing has completed for this document.
- User action: Refer to the displayed LPR messages to ensure your document has been sent to the printer.

**XTC7751W MANUAL LPR IS REQUIRED FOR *dataset name***

- Explanation: Your document has been processed and saved to the named dataset. However, the batch job that sends the dataset to a printer using the TCP/LPR or TCP/IP protocols was not submitted.
- System response: Processing of the document has completed, but the batch job could not be submitted. The document is not requeued.
- User action: Refer to the user action of the accompanying XPAF message for instructions on how to ensure that the batch job will run the next time you send the document to the printer.
- To print the document now, manually issue the LPR command, specifying the named dataset. For example, if you are using IBM TCP/LPR, you could issue this LPR command:
- ```
LPR 'dataset-name(member-name)' AT ip-address PRINTER
queue-name FILTER L BINARY
```
- Refer to IBM's *TCP/IP for z/OS: User's Guide* for more information about the syntax of this command. If you are using another vendor's TCP software, refer to their documentation for valid command syntax.

XTC7752E LPR TRANSMISSION FAILED

- Explanation: Your document has been processed and saved to a dataset. However, it was not transmitted to the printer because an error condition was received from either TCP/LPR or TCP/IP. This error and a suggested solution has been printed to the SYSPRINT SYSOUT dataset from the XTCPCHKR step of the TCP JCL.
- System response: If you have specified PARM='PROMPT' in the XTCPCHKR step, the job has stopped processing and is waiting for an operator response. If you have specified PARM='NOPROMPT', processing of the document has completed, but dataset transmission has failed and the document is not requeued.
- User action: Review the output to determine what caused the TCP transmission error to occur. If you have specified PARM='PROMPT' in the XTCPCHKR step, the operator must respond to the prompt to acknowledge the message. No specific response text is required.
- To print your document, manually issue the LPR command, specifying the named dataset. For example, if you are using IBM TCP/LPR, you could issue this LPR command:
- ```
LPR 'dataset-name(member-name)' AT ip-address PRINTER
queue-name FILTER L BINARY
```
- Refer to IBM's *TCP/IP for z/OS: User's Guide* for more information about the syntax of this command. If you are using another vendor's TCP software, refer to their documentation for valid command syntax.

## **XTC7753I XPAF IS ATTEMPTING TO CONNECT TO TCP/IP INTERFACE**

- Explanation: The XPAF functional subsystem is trying to connect to the TCP/IP address space that will be handling the TCP/IP communication from the OS/390 environment.
- System response: None.
- User action: None.

## **XTC7754I XPAF TCP/IP INTERFACE CONNECTED**

- Explanation: The XPAF functional subsystem has connected to the TCP/IP address space that will be handling the TCP/IP communication from the OS/390 environment.
- System response: None.
- User action: None.

**XTC7755I XPAF TCP/IP INTERFACE IS NOT CONNECTED**

- Explanation: The XPAF functional subsystem has not connected to the TCP/IP address space that will be handling the TCP/IP communication from the OS/390 environment.
- System response: The TCP/IP address space has issued a bad return code when trying to establish connection. XPAF continues processing allowing the other types of printers (e.g., VTAM or channel attached) to print.
- User action: If TCP/IP is required by this functional subsystem, verify that the TCP/IP address space is up and running successfully. Then, verify that the TCPIPJOB initialization parameter set in the XINPARM dataset has the same TCPIPJOB name as the IBM TCP/IP parmlib member for the data component. If both of these conditions are met, close down your TCP/IP address space and restart it. Then, try restarting this functional subsystem.

**XTC7756I CONNECTING TO IP *ip address* TCP PORT=*port id*, QUEUE NAME=*printer name***

- Explanation: The XPAF TCP/IP interface is attempting to connect to the specified IP address for the queue name on the remote port number displayed.
- System response: None.
- User action: None.

**XTC7757E CONNECTION TO IP *ip address* TCP PORT=*port id*, QUEUE NAME=*printer name* FAILED**

- Explanation: The XPAF TCP/IP interface has tried to connect to the specified IP address for the queue name on the remote port number displayed and the connection could not be established.
- System response: XPAF's actions depend on the TCPRETRY printer profile parameter. It will either stop the printer thread, abort the print document, or requeue the print document.
- XPAF will also issue message XTC7765E, which will display the IBM connection failure error code and give the XPAF TCP/IP connection command causing the problem.
- User action: Use the TCP/IP PING command to help diagnose the connection problem. Issue the PING command from the OS/390 TSO command prompt ensuring that the IP address is available from your OS/390 environment not just your local LAN.

**XTC7758I CONNECTION TO IP *ip address* HAS BEEN ESTABLISHED**

- Explanation: The XPAF TCP/IP interface has established a connection to the specified IP address.
- System response: None.
- User action: None.

**XTC7759I CONNECTION TO IP *ip address* HAS BEEN RELEASED**

Explanation: The XPAF TCP/IP interface has released the specified IP address.  
 System response: None.  
 User action: None.

**XTC7760E LPD SERVER AT IP *ip address* HAS REFUSED THE SPECIFIED QUEUE NAME=*printer name***

Explanation: The XPAF TCP/IP interface has received a bad acknowledgment from the LPD server indicating that the queue name is invalid on it's server environment.  
 System response: XPAF's actions depend on the TCPRETRY printer profile parameter. It will either stop the printer thread, abort the print document, or requeue the print document.  
 User action: Correct the queue name to a a valid queue name for that IP address.

**XTC7761E LPD SERVER AT IP *ip address* HAS RETURNED A BAD ACK AFTER A SEND DATA REQUEST. QUEUE NAME=*printer name***

Explanation: The XPAF TCP/IP interface has received a bad acknowledgment from the LPD server indicating that the sending of data frames has been rejected or lost.  
 System response: XPAF's actions depend on the TCPRETRY printer profile parameter. It will either stop the printer thread, abort the print document, or requeue the print document.  
 User action: Ensure that the receiving LPD server is not in a wait state or has not been recycled during this time period. This could cause a loss of the LPD service at that IP address. If neither of these has occurred, it could be the physical network at the time being serviced.  
 When LPD service availability has been verified, restart the print job. If an error condition still exists, recycle the LPD server machine (i.e., power it on and off) to ensure that connectivity to the local area network is reestablished.

**XTC7762E LPD SERVER AT IP *ip address* HAS RETURNED A BAD ACK AFTER RECEIVE DATA FILE REQUEST. QUEUE NAME=*printer name***

Explanation: The XPAF TCP/IP interface has received a bad acknowledgment from the LPD server indicating that after sending the receive control data block, the LPD service has rejected the request.  
 System response: XPAF's actions depend on the TCPRETRY printer profile parameter. It will either stop the printer thread, abort the print document, or requeue the print document.  
 User action: Ensure that the receiving LPD server is not in a wait state or has not been recycled during this time period. This could cause a loss of the LPD service at that IP address. If neither of these has occurred, it could be the physical network at the time being serviced.  
 When LPD service availability has been verified, restart the print job. If an error condition still exists, recycle the LPD server machine (i.e. power it

on and off) to ensure that connectivity to the local area network is reestablished.

**XTC7763E LPD SERVER AT IP *ip address* HAS RETURNED A BAD ACK AFTER RECEIVE CONTROL FILE REQUEST. QUEUE NAME=*printer name***

Explanation: The XPAF TCP/IP interface has received a bad acknowledgment from the LPD server indicating that after sending the receive control file control block, the LPD service has rejected the request.

System response: XPAF's actions depend on the TCPRETRY printer profile parameter. It will either stop the printer thread, abort the print document, or requeue the print document.

User action: Ensure that the receiving LPD server is not in a wait state or has not been recycled during this time period. This could cause a loss of the LPD service at that IP address. If neither of these has occurred, it could be the physical network at the time being serviced.

When LPD service availability has been verified, restart the print job. If an error condition still exists, recycle the LPD server machine (i.e. power it on and off) to ensure that connectivity to the local area network is reestablished.

**XTC7764E LPD SERVER AT IP *ip address* HAS RETURNED A BAD ACK AFTER RECEIVE COMPLETE CONTROL FILE REQUEST. QUEUE NAME=*printer name***

Explanation: The XPAF TCP/IP interface has received a bad acknowledgment from the LPD server indicating that after sending the receive complete control file control block, the LPD service has rejected the request.

System response: XPAF's actions depend on the TCPRETRY printer profile parameter. It will either stop the printer thread, abort the print document, or requeue the print document.

User action: Ensure that the receiving LPD server is not in a wait state or has not been recycled during this time period. This could cause a loss of the LPD service at that IP address. If neither of these has occurred, it could be the physical network at the time being serviced.

When LPD service availability has been verified, restart the print job. If an error condition still exists, recycle the LPD server machine (i.e., power it on and off) to ensure that connectivity to the local area network is reestablished.

**XTC7765E TCP/IP RC=*return code*; FUNCTION=*function***

Explanation: The XPAF TCP/IP interface has received a bad return code from the IBM TCP/IP address space indicating a failure of a TCP/IP command.

System response: XPAF's actions depend on the TCPRETRY printer profile parameter. It will either stop the printer thread, abort the print document, or requeue the print document.

User action: The return code displayed in this message is the IBM TCP/IP socket return code. An explanation of these can be found in the IBM TCP/IP *API Reference Manual*, appendix D, "Return codes."

Common return code 60 indicates an IP address is not accessible from the OS/390 system (i.e., may be powered off). Common return code 61

indicates that the IP address is in use on the network and could not be acquired in a timely manner.

Ensure that the receiving LPD server is not in a wait state or has not been recycled during this time period. This could cause a loss of the LPD service at that IP address. If neither of these has occurred, it could be the physical network at the time being serviced.

When LPD service availability has been verified, restart the print job. If an error condition still exists, recycle the LPD server machine (i.e., power it on and off) to ensure that connectivity to the local area network is reestablished.

**XTC7766E**     *domain name* **DOMAIN NAME IS NOT KNOWN BY THE DOMAIN NAME SERVICE**

Explanation:     You entered a domain name that is not recognized by the domain name service.

System response:     XPAF will act depending on the printer profile TCPRETRY; either the printer thread will be stopped, the print job will be aborted, or the print document will be requeued. XPAF will not try to reconnect to the given domain name.

User action:     Ensure that the IPADDRESS specified in the XPAF printer profile member matches the DNS server from your host environment. If you do not have an active DNS environment, XPAF will look in the HOST.SITE file created by the IBM sockets MAKESITE command. Check in the HOST.SITE file for a valid domain name. MAKESITE only allows names of up to 24 characters.

**XTC7767I**     **ALL LOCAL PORT ADDRESSES IN USE OR IN TIME-WAIT STATE - RETRYING LOCAL ACQUISITION**

Explanation:     All ports specified by the TCPBIND printer parameter are busy.

System response:     XPAF will continue to try all ports defined by the TCPBIND parameter until a port can be acquired. When all ports have been tried and none are available, XPAF will wait for 20 seconds and try again. No JES commands will be honored by XPAF during the 20 second wait.

User action:     Verify that the receiving IPADDRESS will accept TCP/IP communications from any other ports.

Recent versions of Novell LPD servers allow connection to any port numbered between 1 and 1024. As an example, if TCPBIND=(900,125) is set on your system, message XTC7767 will not appear unless you have more than 125 active printers printing to the Novell server from your mainframe.

Older versions of Novell LPD servers only allow connections through ports 721 to 731, when using one of these servers set TCPBIND=(721,11).

Servers requiring the TCPBIND=(721,11) setting are rare. Systems with Xerox TCP/IP Network Interface cards, and Windows and Unix systems never need the TCPBIND setting as print jobs can be sent from any local port with an assigned IBM socket.

Local ports in TIME-WAIT status can be displayed by the IBM NETSTAT command. If you have a number of ports in this status you need to acquire a PTF from IBM (i.e., PN88789).

**XTC7768I ABOVE ERROR CAUSED BY RETURN CODE 90 FROM TCP/IP**

- Explanation: The TCP/IP interface has returned an error as described in the preceding message. The error was indicated by a return code of 90.
- System response: The system response is as documented in the preceding message.
- User action: The TCP/IP error could be due to one of these reasons:
- You may have the wrong LPR queue name for the receiving LPD service.
  - The receiving device may need to have the mainframe IP address in its host's name table.
  - The receiving device may have the default gateway defined incorrectly.
  - The receiving device may not have started the LPD service
  - The TCP/PORT number is specified incorrectly in this printer definition. LPR/LPD service uses port 515.
  - The IP address you are going to may be in use elsewhere. Turn off the device then PING the IP address. If the PING is successful, the IP address is assigned to another device.

**XTC7769E COULD NOT *function* INPUT LPR DATASET *dsn* RC=X'rc'**

- Explanation: The temporary dataset containing the file to be sent to the printer via TCP/IP LPR protocol either could not be allocated or it could not be opened.
- System response: The current print job is aborted and re-queued.
- User action: This is an internal error. Contact Xerox technical support.

**XTC7770W UNABLE TO PROCESS PARAMETER=MEMBER BECAUSE LPRDSN= HAS NOT BEEN SPECIFIED IN THE PRINTER PROFILE TABLE**

- Explanation: The user has specified a PDS member parameter (i.e. XTCPJNAM=) in the printer profile, but has omitted the LPRDSN= parameter to specify which PDS to retrieve the member from.
- System response: The print job will continue to print without processing of the member.
- User action: Specify a PDS library via the LPRDSN= parameter or remove the member parameter from the printer profile.

**XTC7771E E-MAIL ATTACHMENT SIZE OF SIZE BYTES EXCEEDS THE MAXIMUM ALLOWABLE OF MAX BYTES**

- Explanation: The file that is to be sent as an e-mail attachment exceeds the size specified by the EMAILMAX parameter specified in the printer profile.
- System response: The document will not be sent via e-mail. The document will be aborted and re-queued.
- User action: Either increase the value specified on the EMAILMAX printer profile parameter or reduce the size of the document to be sent.

**XTC7772I      CONNECTING TO MAIL SERVER: mailserver PORT: port**

Explanation:      This is an informational message indicating that XOSF is attempting to connect to the SMTP mail server: *mailserver* via port: *port*.

System response:      Processing continues.

User action:      None.

**XTC7773E      USERID userid WAS NOT FOUND IN THE EMAILADDRESS TABLE table. THE EMAIL COULD NOT BE SENT**

Explanation:      When attempting to send a document via e-mail, XOSF was unable to find a USER entry for the userid specified. The e-mail could not be sent.

System response:      The document is aborted.

User action:      Add a USER entry in the e-mail address table for the userid specified in the message.

**XTC7775E      INVALID IPV6 ADDRESS: ipaddress**

Explanation:      The IP address, *ipaddress*, is not a valid IPv6 address.

System response:      The document is aborted.

User action:      Correct the IP address.

**XTC7776I      CONNECTING TO IPV6 ADDRESS ipaddress TCP PORT=port QUEUENAME=portqueue**

Explanation:      The XPAF TCP/IP interface is attempting to connect to the specified IP version 6 address for the specified queue name and port.

System response:      TProcessing continues.

User action:      None.

## XTD messages

---

### XTD0303E FIRST RECORD OF *member name* IS NOT A VALID HEADER RECORD

Explanation: The font header could not be recognized. The format of the dataset or member's first record does not conform to the Xerox header record format. If the input is a sequential dataset, the word INPUT is substituted for *member name* in the message text.

System response: Custom font installation is terminated.

User action: Verify that the input is a valid Xerox custom font.

### XTD0304E SECOND RECORD OF *member name* IS NOT A VALID DESCRIPTION RECORD

Explanation: The format of the second record in the dataset does not conform to the Xerox description record format. The font cannot be validated.

System response: Custom font installation is terminated.

User action: Verify that the input is a valid Xerox custom font.

### XTD0305E COULD NOT *activity* TABLE *table name* operation. THM RC=X'return code'

Explanation: An attempt to process the indicated table failed. *Operation* identifies the type of processing that was being performed when the error occurred.

System response: Command processing is terminated.

User action: Call Xerox Technical Support.

### XTD0308I *number resource type* PROCESSED, *number* WITH ERRORS

Explanation: The identified number of the resource type indicated has been installed.

System response: Processing continues.

User action: If no errors are indicated, no action is required. If errors occurred, review the XOAF log for more information.

### XTD0316W THE RESOURCE *resource name* HAS A CHARACTER CODE OF X'*value*' WHICH EXCEEDS X'00FF'. THIS VALUE HAS BEEN TRUNCATED TO X'*value*'

Explanation: The named resource is corrupted.

System response: Processing continues with a truncated value.

User action: Replace the font.

**XTD0319E     IMPROPER *attribute* FOR DSNAME *dataset name*. REQUIRED *attribute* IS: *value***

Explanation:     The specified dataset does not have the proper RECFM, DSORG, and/or LRECL.  
 System response:     The dataset is bypassed and processing continues with the next dataset.  
 User action:     Correct the dataset as indicated in the message and retry the option.

**XTD0320I     FONT *font name* INSTALLED**

Explanation:     The named font has been loaded, and the necessary font table entries have been generated.  
 System response:     Custom font installation continues.  
 User action:     None required.

**XTD0324W     CANNOT USE CURRENT XOAF LOG AS MESSAGE DATASET**

Explanation:     The message dataset you specified is the current XOAF log dataset.  
 System response:     Additional messages are suppressed; custom font installation continues.  
 User action:     Specify an alternate dataset with these attributes:  
                      RECFM=FB  
                      DSORG=PS  
                      LRECL=133  
                      BLKSIZE=3325

**XTD0326I     OLD ENTRY: *value1*; NEW ENTRY: *value2*; *action***

Explanation:     *Value1* identifies an existing entry in the IPSTND table; *value2* identifies the corresponding value provided in CD#FILE on the font file distributed by Xerox Font Services. *Action* indicates whether the existing entry in the IPSTND table has been replaced.  
 System response:     Custom font installation continues.  
 User action:     None required.

**XTD0327I     PROCESSING COMPLETED**

Explanation:     Custom font installation is completed.  
 System response:     None.  
 User action:     None required.

**XTD0328I     *entry* ENTRY FOR KEY=*key* INSTALLED**

Explanation:     The identified XPAFA2A table entry has been created or replaced.  
 System response:     Custom font installation continues.  
 User action:     None required.

**XTD0331I**     *entry* **ENTRY FOR FONT** *font* **INSTALLED**

Explanation:     The identified table entry has been created or replaced for the named font. This message is issued for the XPAFAFW and XPAFI2X tables.

System response:     Custom font installation continues.

User action:     None required.

**XTD0500E**     **COULD NOT** *activity* **DSNAME** *dataset name*. **EI RC=X**'return code'

Explanation:     The indicated *activity* for the named dataset could not be performed.

System response:     Custom font installation is terminated.

User action:     If the problem persists, call Xerox Technical Support.

**XTD0501E**     **COULD NOT** *activity* **FOR MEMBER** *member name* **OF DSNAME** *dataset name*. **EI RC=X**'return code'

Explanation:     The indicated operation for the named dataset member could not be performed.

System response:     The font load termination is terminated.

User action:     If the problem persists, call Xerox Technical Support.

**XTD1706I**     **NO ENTRIES SATISFY INPUT SELECTION CRITERIA.** (*input member name*)**GIVEN**

Explanation:     The *input member name* specified wildcards. However, either no member in the supplied library matched the wildcard specification, or the input member was not found.

System response:     Custom font installation is terminated.

User action:     Examine the member list for the library and verify that a match can be made.

**XTD3010F**     **COULD NOT GET X**'bytes of storage' **BYTES OF MEMORY** *activity*

Explanation:     This is an internal error.

System response:     Processing continues.

User action:     If you are running a batch job, cancel the job and specify a larger region size before running the job again.

**XTD3011E**     **COULD NOT RELEASE X**'amount of storage' **BYTES OF MEMORY FROM LOCATION** *X'getmained area address'* *activity*

Explanation:     This is an internal error.

System response:     Processing may or may not continue. If you are installing a large number of custom fonts, your system may run out of available memory.

User action:     Call Xerox Technical Support.

**XTD3015E** **COULD NOT** *command* **LIBRARY** *library ddname activity*. **LDM RC=X'***return code'*

Explanation: XPAF could not perform the named activity on the specified library.  
 System response: Custom font installation is terminated.  
 User action: Ensure the library exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XTD3016E** **COULD NOT** *command* **MEMBER** *member name* **OF LIBRARY** *library ddname activity*. **LDM RC=X'***return code'*

Explanation: XPAF could not perform the named activity on the specified member.  
 System response: Custom font installation is terminated.  
 User action: Ensure the member exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XTD3017E** **COULD NOT** *command* **LCA** *activity*. **LDM RC=X'***return code'*

Explanation: This is an internal error.  
 System response: Custom font installation is terminated.  
 User action: Call Xerox Technical Support.

**XTD3018E** **COULD NOT ACQUIRE TCB** *activity*. **THM RC=X'***return code'*

Explanation: This is an internal error.  
 System response: Custom font installation is terminated.  
 User action: Call Xerox Technical Support.

**XTD6402E** **COULD NOT** *command* **ITEM** *item name* **IN TABLE** *table name activity*. **THM RC=X'***return code'*

Explanation: The indicated item is not in the named table.  
 System response: Custom font installation is terminated.  
 User action: Call Xerox Technical Support.  
 User action:

## XTW messages

---

### XTW0001I *message text*

Explanation: This message supplements message XTW1502E, and identifies the cause of the allocation/deallocation error.

System response: None.

User action: If possible, correct the problem. Otherwise, call Xerox Technical Support.

### XTW0002I *message text*

Explanation: This message supplements message XTW1504I, and identifies the name of the dataset being written to disk.

System response: None.

User action: None required.

### XTW1501E **ESTAE FAILURE ON ENTRY TO XTWMAIN. RC=return code; IC=information code**

Explanation: This is an internal error.

System response: Output-to-file processing is terminated.

User action: Identify the cause of the error, correct it, and try again. If the problem persists, call Xerox Technical Support.

### XTW1502E *allocation type* **ERROR. RC=X'return code'; EC=X'error code'; IC=X'information code'**

Explanation: The error occurred while allocating or deallocating the output dataset.

System response: Output-to-file processing is terminated.

User action: A following message should explain the cause of the problem. Correct the problem and try again. If there are no other messages, call Xerox Technical Support.

### XTW1503E *media type* **OPEN ERROR**

Explanation: A non-zero return was received in response to an OPEN request. *Media type* is either DASD if output is being directed to a DASD dataset, or file if output is being directed to file.

System response: Output-to-file processing is terminated.

User action: Determine the cause of the error, correct it, and try again. If the problem persists, call Xerox Technical Support.

**XTW1504I**     *action* **OUTPUT TO** *media type*. **UNIT=***unit address*; **VOLSER=***volume serial number*

Explanation:     This message indicates where printer output data is or has been written. The VOLSER identifies the correct volume.

System response:     Printer output-to-file/disk processing continues.

User action:     None required.

**XTW1509E**     **RECORD(S) TOO LONG FOR FILE/DISK OUTPUT, TRUNCATED TO 256 BYTES**

Explanation:     While generating output to file or disk, XOSF encountered an input record longer than the maximum output record length (256 bytes).

System response:     Output-to-file and/or disk processing continues; however, the output record is truncated to 256 bytes. This message is issued only once, although many records may be truncated.

User action:     When the dataset is printed, some print lines may have lost data. If data is missing, the input dataset should not be used as input for output-to-file and/or disk processing.

**XTW1510I**     **ATTEMPTING ALLOCATION OF FILE FOR OUTPUT DATASET**

Explanation:     Dynamic allocation of a file drive is being attempted for a printer output dataset.

System response:     Output-to-file processing continues.

User action:     None required.

**XTW1512E**     **SMS REASON CODE=X'***reason code***'**

Explanation:     An error occurred while allocating the output dataset to disk. The allocation request failed. The error was detected by System Managed Storage (SMS).

System response:     Output-to-disk processing is terminated.

User action:     The SMS reason code describes the reason that the request failed. For more information, refer to SMS reason code in the "Requesting Dynamic Allocation Functions: Setting Up the Request Block Extension" section of the *z/OS Systems Programming Authorized Assembler Services Guide*.

**XTW1513E**     *abend code - reason code* **ABEND DETECTED DURING FILE/DISK OUTPUT**

Explanation:     A system abend occurred during file/disk output writer processing.

System response:     Output-to-file/disk processing is terminated.

User action:     The abend code and reason code describe the reason that the abend occurred. For more information, refer to *z/OS Systems Programming System Codes*.

**XTW4020E RECORD IS TOO BIG FOR OUTPUT FILE. INCREASE OPDLRECL TO AT LEAST n**

- Explanation: An attempt was made to write a record to the disk output file that is longer than the LRECL defined by OPDLRECL. The record would not fit into this file.
- System response: The document is aborted and held in the output queue.
- User action: Increase the value specified in XINSXOSF for OPDLRECL to at least the value specified by 'n' in the message.

**XTW4157W THE RENAME DATASET NAME IS BLANK. THE DATASET WILL NOT BE RENAMED.**

- Explanation: For a TCPMODE=RENAME printer, The XODBMFNM field is blank
- System response: The dataset is not renamed.
- User action: Check that the XODBMFNM field specifies a valid dataset or file name. The XODBMFNM can be populated by the MAILFILE= IBM JCL keyword, LCDS document splitting, the enhanced DJDE command XFILENAME or via XOSF User Exit 02.

**XTW4158W THE RENAME DATASET *name1* COULD NOT BE ALLOCATED. THE DATASET *name2* WILL NOT BE RENAMED.**

- Explanation: For a TCPMODE=RENAME printer, XOSF was unable to allocate the dataset, *name1*
- System response: The temporary dataset *name2* is not renamed.
- User action: Check that the XODBMFNM field specifies a valid dataset or file name. The XODBMFNM can be populated by the MAILFILE= IBM JCL keyword, LCDS document splitting, the enhanced DJDE command XFILENAME or via XOSF User Exit 02.

**XTW4180I OUTPUT COPIED TO: *name***

- Explanation: The temporary dataset has been successfully copied to the new dataset/file *name*
- System response: None.
- User action: None.

**XTW4181E COULD NOT *action* RENAME DATASET *name*, RC=X'return code'.**

- Explanation: When attempting to perform the action indicated on the dataset, *name*, and error was encountered
- System response: The temporary dataset was not renamed.
- User action: Check for additional error messages, resolve the problem and retry the job.

## XUC messages

---

### XUC0001I *message text*

- Explanation: *Message text* consists of a message produced by the forms conversion utility; it begins with a message number prefixed by XFU. Refer to “[XFU messages](#)” for an explanation of this message.
- System response: Refer to the documentation for the XFU message.
- User action: Refer to the documentation for the XFU message.

### XUC0305E **COULD NOT** *activity* **TABLE** *table name operation*. **THM RC=X'***return code'*

- Explanation: An attempt to process the named table failed. *Operation* identifies the type of processing that was being performed when the error occurred.
- System response: Font conversion is terminated.
- User action: Call Xerox Technical Support.

### XUC3010F **COULD NOT GET X'***amount'* **BYTES OF MEMORY** *activity*

- Explanation: This is an internal error. The specified amount of memory needed for image rotation was not available.
- System response: Font conversion is terminated, but processing continues.
- User action: Increase the memory space parameter to run in a larger partition, then rerun the request. If this fails, call Xerox Technical Support.

### XUC3011E **COULD NOT RELEASE X'***amount'* **BYTES OF MEMORY FROM LOCATION X'***address'* *activity*

- Explanation: This is an internal error. The specified amount of memory could not be returned to the system.
- System response: Conversion is terminated, but processing continues.
- User action: Call Xerox Technical Support.

### XUC3015E **COULD NOT** *command* **LIBRARY** *dataset name activity*. **LDM RC=X'***return code'*

- Explanation: XPAF could not perform the named activity on the specified library.
- System response: Processing continues.
- User action: Ensure the library exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XUC3016E**     **COULD NOT** *command* **MEMBER** *member name* **OF LIBRARY** *dataset name* *activity*.  
**LDM RC=X'***return code'*

Explanation:     XPAF could not perform the named activity on the specified member.  
System response:     Document processing continues.  
User action:     Ensure the library exists and is available to XPAF. Review the system log for additional messages that identify the cause of the problem, and take the appropriate action. If the problem persists, call Xerox Technical Support.

**XUC3017E**     **COULD NOT** *command* **LCA** *activity*. **LDM RC=X'***return code'*

Explanation:     This is an internal error.  
System response:     Processing is terminated, but XOSF remains active.  
User action:     Call Xerox Technical Support.

**XUC3018E**     **COULD NOT ACQUIRE TCB** *activity*. **THM RC=X'***return code'*

Explanation:     This is an internal error.  
System response:     Document processing is terminated. The XPAF address space remains active.  
User action:     Call Xerox Technical Support.

**XUC3020E**     **COULD NOT** *operation* **MEMBER** *member name* **IN PRIMARY OR SECONDARY FORM LIBRARY**

Explanation:     The document called for a form that XPAF could not obtain from either the primary (DFORMLIB) or secondary (CFORMLIB) form library.  
System response:     Processing continues, but the form is not downloaded.  
User action:     Load the named form into one of the form libraries that is specified in the XOSF start-up proc.

**XUC3701E**     **UNRECOGNIZED PAL COMMAND;** *command name*

Explanation:     This is an internal error.  
System response:     Document processing is terminated, but XOSF remains active.  
User action:     Call Xerox Technical Support.

**XUC3708W**     **PRINTER DOES NOT SUPPORT IMAGES IN FORMS. IMAGE DELETED**

Explanation:     The dynamic conversion of images contained within a centralized .FRM to decentralized format is only supported on certain printers. This feature is not available on the 3700 or 4045 printers.  
System response:     The image is deleted from the converted form.  
User action:     Route your print job to a printer that supports images within forms.

**XUC3921E     *module name* MODULE CANNOT BE LOADED. CALL SYSTEM ADMINISTRATOR**

Explanation:     The named load module could not be located in the XPAF load library.  
 System response:     Processing is terminated.  
 User action:     This message indicates a problem with the installation or setup of the XPAF product. Contact your local person responsible for product installation and maintenance. If you believe you are receiving this message in error, call Xerox Technical Support.

**XUC4203E     FAILURE DURING TABLE FETCH. THM EC=*error code***

Explanation:     This is an internal error.  
 System response:     Form conversion is terminated, but processing continues.  
 User action:     Call Xerox Technical Support.

**XUC6402E     COULD NOT *command* ITEM *item name* IN TABLE *table name* operation. THM RC=*X'return code***

Explanation:     The named item was not found in the named table. This message is issued for diagnostic purposes. *Operation* identifies the type of processing that was being performed when the error occurred.  
 System response:     Conversion is terminated, but processing continues.  
 User action:     Validate the CODE DJDE assignment with the selected font. If the problem persists, call Xerox Technical Support.

**XUC6403E     RECORD EXCEEDS 256 BYTES. DATA LOSS DUE TO TRUNCATION**

Explanation:     This is an internal error.  
 System response:     Record length is truncated to 256 bytes. Data may be lost, but processing continues.  
 User action:     Call Xerox Technical Support.

**XUC6404E     RECORD EXCEEDS FRAGMENT SIZE. DATA LOSS IS EXPECTED**

Explanation:     This is an internal error.  
 System response:     The record is discarded and processing continues.  
 User action:     Call Xerox Technical Support.

**XUC6405E     INVALID FONT HEADER RECORD IN DATA STREAM**

Explanation:     An inline font did not have a recognized font ID.  
 System response:     Font downloading stops, and the records are sent as data.  
 User action:     Examine the font resource for proper font format.

**XUC6407E NO DDNAME SPECIFIED** *activity*

Explanation: The font, form, or image library was not named. Spaces were found instead of the DD name.

System response: Resource loading is terminated, but processing continues.

User action: Check the printer profile for the correct library name.

**XUC6408E PREMATURE EOF WHILE READING IMAGE LIBRARY**

Explanation: End-of-file was encountered while trying to read data. The byte count specified in the image header was not satisfied, but an EOF was read.

System response: Processing continues with the available data, although the image may be truncated.

User action: Verify the integrity of the library member.

**XUC6409E INVALID IMAGE HEADER RECORD. GRAPHIC WINDOW COMMAND IS SYNTACTICALLY INCORRECT**

Explanation: This is an internal error.

System response: Image loading is terminated but processing continues.

User action: Call Xerox Technical Support.

**XUC6410I IMAGE** *image name* **DOES NOT CONFORM TO STANDARD IN** *axis-DIRECTION*, *value* **SUPPLIED BY HEADER**

Explanation: The X- and Y-directions are not multiples of 8.

System response: X- and Y-directions are padded with white space and processing continues.

User action: Check the source of the .IMG file to determine how it was made. Padding may result in undesirable effects in some applications.

**XUC6412I RASTER COUNT** (*count value*) **DOES NOT AGREE WITH VALUE SUPPLIED BY HEADER** (*supplied value*) **FOR IMG** *image name*

Explanation: The number of raster lines differed from what was encountered during image decompression.

System response: Excess lines are discarded; extra blank lines are added to satisfy the header requirements. Processing continues.

User action: Check the source of the image for possible errors.

**XUC6413E IMAGE** *image name* **CANNOT BE ACCESSED IN SUPPLIED LIBRARIES**

Explanation: The indicated image could not be found in either the primary or secondary library.

System response: The requested image is ignored and processing continues.

User action: Supply the image in the correct library as named in the printer profile.

**XUC6414W FORM** *form name* **MAY BE TOO COMPLEX FOR PRINTER.** *number* **LINES USED**

Explanation: The named form uses more than 1200 absolute position commands. This form may be too complex to print. In addition, the message "PAGE TOO COMPLEX" may appear on the printer console.

System response: Processing continues.

User action: Simplify or split the form.

**XUC6417F RESOURCE** *resource member name*, **TYPE** *resource type* **FAILED EXIT 6 AUTHORIZATION**

Explanation: The current user exit 06 has instructed XPAP not to allow the user to access this particular resource.

System response: The current print job is aborted.

User action: Contact your systems programmer for information on the operation of user exit 06 at your site.

**XUC6422I** *printer name activity* **TO PAGE** *page number*

Explanation: The printer has performed the specified *activity*. *Activity* indicates a JES command to forward space or backspace to a specified *page number*.

System response: Processing continues.

User action: None required.

**XUC9440E ABEND IN** *module name* **SNAP DUMP ID=***dump id*

Explanation: This is an internal error.

System response: Document processing is terminated, but the XOSF address space remains active.

User action: Call Xerox Technical Support.

**XUC9441E ABEND CODE: SYSTEM=***system code*, **USER=***user code*

Explanation: This is an internal error.

System response: Processing continues.

User action: Call Xerox Technical Support.

**XUC9442E REGISTERS** *registers* *xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx*  
*xxxxxxxx*

Explanation: This message accompanies XUC9441E to provide additional diagnostic information.

System response: Processing continues.

User action: Call Xerox Technical Support.

**XUC9443E**    **NEXT INSTRUCTION IS:** *instruction*

Explanation:    This message accompanies XUC9441E to provide additional diagnostic information.

System response:    Processing continues.

User action:    Call Xerox Technical Support.

## XUX messages

---

**XUX2624W**    **USER EXIT NUMBER** *user exit number, load module name*, **ABENDED WITH CODE**  
**X'abend code'** **IN TASK** *name* **FROM REQUESTOR** *requestor*

- Explanation:    The specified user exit abended in the indicated FSA subtask or program.
- System response:    If you specified ESTAE=Y in the initialization parameters, a dump is produced to the SYSUDUMP DD statement. For document processing, the document is requeued on hold, and the printer thread is drained. For non-document processing, the requested function is bypassed.
- If you specified ESTAE=N, z/OS may produce a dump to SYSUDUMP. Processing in the subtask halts. Depending on which subtask the abend occurred in, some functions may continue to run.
- User action:    Refer to [Section Two: Installing and Customizing XPAF](#) for help in diagnosing and debugging the user exit. Refer to your system codes manual for an explanation of the abend code. Either correct the error in the user exit, or turn off the user exit in the initialization parameters. Restart XOSF.

**XUX2626I**    *user-generated message text*

- Explanation:    In any of the user exits, you requested that XOSF issue a message at the end of user exit processing.
- System response:    Processing continues.
- User action:    The action is user-defined.

**XUX2627W**    **UNABLE TO INITIALIZE USER EXIT.** *name* **AREA GETMAIN FAILED FOR** *number of bytes*  
**BYTES WITH RC=X'***return code'*

- Explanation:    XOSF was calling a user exit but was unable to get the amount of storage needed.
- System response:    XOSF processing continues as if the exit ended with a zero return code. The exit is not called.
- User action:    If the message is for the work area, modify the user exits to need less work area and specify a smaller work area size in the USRXITWA initialization parameter. Restart XOSF.
- If the message is for the parm area, call Xerox Technical Support.
- This may be an error in the size of the parameters that are input to the user exit, or it may be due to some other function causing an unusually large consumption of private region storage.
- Ensure that you specified a reasonable exit work area size in the USRXITWA initialization parameter.

**XUX2628W    UNABLE TO INVOKE USER EXIT NUMBER *user exit number* FOR TASK *printer task name* BECAUSE USER EXIT NUMBER *user exit number* IS CURRENTLY ACTIVE**

Explanation: XPAF does not support nested user exits within the same printer task because all user exits for the same printer task share a common work area and enqueue lock. The user exit cannot be invoked because another user exit is already being executed for the named printer task.

System response: The user exit that is attempting to be invoked is disabled until the executing user exit has completed processing. Document processing continues.

User action: None required. However, this warning message may be suppressed in the standard way or you can amend the executing user exit to temporarily disable the other user exit until the executing user exit completes processing.

The following assembler statement disables a specific user exit:

XC UXITXACT,=A(#EXIT*nn*)                      Where *nn* represents the  
2-digit user exit number

The following assembler statement enables a specific user exit:

OC UXITXACT,=A(#EXIT*nn*)                      Where *nn* represents the  
2-digit user exit number

For additional information, call Xerox Technical Support.

## XV2S messages

---

### **XV2S0000(I OR E) - PRINTER XXXXXXXX - YYYYYYYYYYYYYYYYYY**

Explanation: This is a XV2S generalized self-explanatory message.  
 System response: None.  
 User action: Review the message text. These messages are for informational purposes.

### **XV2S0001E VTAM ERROR ON XXXX RTNCD/FDBK =X'NNNN' SENSE =X'NNNN'**

Explanation: A VTAM error occurred during processing which is shown in the message.  
 System response: None  
 User action: Use the return code, Feedback and sense code to diagnose the issue.

### **XV2S0002E UNSUPPORTED FUNCTION REQUESTED IS CCCCC**

Explanation: VTAM Function is not supported.  
 System response: None  
 User action: Verify Function availability on your z/OS level and if not available contact XPAF support.

### **XV2S0003E DYNAMIC ALLOCATION ERROR = NNNNN**

Explanation: Explanation The allocation of the SYSOUT data set that streams the VTAM data to JES SPOOL could not be allocated.  
 System response: None  
 User action: Ensure that there is no error messages on the z/OS SYSLOG showing the reason for the allocation failure. Verify that the XV2S logical printer parameters are correct. This includes ensuring that the OUTPUT descriptor used in the printer definition is actually in the XV2S JCL procedure otherwise the failure will occur.

### **XV2S0003I VERIFY OUTPUT DESCRIPTOR IS DEFINED IN THE XV2S STARTED TASK JCL**

Explanation: NONE  
 System response: The above error has occurred and this is a secondary message to help diagnose quickly what may have happened.  
 User action: Verify z/OS SYSLOG for failure messages at the allocation time and verify printer definition in the XV2S control file.

**XV2S0004E UNABLE TO ACQUIRE 0100 BYTES OF STORAGE**

Explanation: Memory acquisition by the executing program code cannot be satisfied.  
System response: None.  
User action: Try raising the REGION size on the XV2S JCL procedure.

**XV2S0005E UNABLE TO GENERATE VTAM « TYPE »**

Explanation: Unable to generate VTAM control block shown in message « TYPE ».  
System response: None  
User action: Look on z/OS SYSLOG to see any additional error messages to help diagnose the failure.

**XV2S0006I XXXXXXXX IS AN INVALID KEYWORD FOR PRINTER**

Explanation: XV2S control member has an invalid keyword in for the printer.  
System response: None.  
User action: Change the printer keyword that is invalid and try to start the logical printer again.

**XV2S0007E ACB OPEN FAILURE FOR ACB XXXXXXXX ERROR CODE = NN**

Explanation: Trying to start a XV2S logical printer has caused the OPEN for an ACB which has failed.  
System response: None  
User action: Verify that the ACB is defined correctly in the VTAMLST data set and check the z/OS SYSLOG for additional diagnostic messages. The Error code can also be used for diagnosis if need be.

**XV2S0008I INVALID OPERATOR COMMAND ENTERED = XXXXXXXXXXXX**

Explanation: An XV2S operator command has been given that is invalid.  
System response: None.  
User action: Change the invalid command and try again.

**XV2S0009I INVALID PRINTER NAME IN COMMAND =**

Explanation: An operator command specified an invalid printer name.  
System response: None.  
User action: Change the operator command to contain a valid printer name.

#### **XV2S0051I - OPNSEC BIND SUCCESSFUL FOR PRINTER**

Explanation: VTAM connection has successfully bound to the SLU from the receiver.  
System response: None.  
User action: None.

#### **XV2S0052E - OPNSEC BIND FAILED FOR PRINTER**

Explanation: An successful bind has occurred and requires investigation.  
System response: None.  
User action: There is usually z/OS SYSLOG messages showing what has caused the BIND failure; use this information to diagnose the connection issues. Additional XV2S messages will also be displayed.

#### **XV2S0053E - SESSIONC REJECT FOR PRINTER**

Explanation: A VTAM start session request has been rejected by VTAM.  
System response: None  
User action: There is usually z/OS SYSLOG messages showing what has caused the reject failure; use this information to diagnose the connection issues. Additional XV2S messages will also be displayed.

#### **XV2S0054I - SESSIONC START DATA TRAFFIC FOR PRINTER**

Explanation: VTAM starting process for data streaming via the logical XV2S printer.  
System response: None  
User action: None.

#### **XV2S0055E - SESSIONC START DATA TRAFFIC FAILED FOR PRINTED**

Explanation: VTAM streaming from the SLU was not able to start.  
System response: None  
User action: There is usually z/OS SYSLOG messages showing what has caused the reject failure; use this information to diagnose the connection issues. Additional XV2S messages will also be displayed.

#### **XV2S0100I - XV2S01 JES document - CLASS = (JES class) DEST = (JES Destination) WRITER = (JES Writer) FORM = (JES Form) OUTDES = (OUTPUT descriptor)**

Explanation: XV2S has received a connection from the SLU and has created a document on the JES SPOOL with the reported attributes. The attributes are determined from the options supplied in the XV2S printer definition control file.  
System response: None  
User action: None required. This message is provided as an optional mechanism to enable operational automation software to perform an action when ever XV2S receives a document from VTAM.

## **XV2S1000E - NO PRINTERS TO DISPLAY**

User action: XV2S control member has no valid printers started in the executing XV2S address space.

System response: None

User action: Change the printer keywords so that a printer can be started successfully in the XV2S address space.

## **XV2S0100I CHECKING LICENSE FOR CPUID: *cpuid***

Explanation: XV2S is checking the license string file to ensure it is valid to run on the cpuid specified.

System response: Processing continues.

User action: None. This message is for informational purposes only.

## **XV2S0101F INVALID CPUID: *cpuid***

Explanation: The cpuid specified in the license string is in an invalid format.

System response: XV2S Initialization fails. XV2S terminates.

User action: Correct the license string in the XV2S license string member and make sure it is the correct license string for this system.

## **XV2S0102F DATE NOT IN DD-MMM-YYYY FORMAT: *date***

Explanation: The date specified in the license string is in an invalid format.

System response: XV2S Initialization fails. XV2S terminates.

User action: Correct the license string in the XV2S license string member and make sure the date is in the correct format.

## **XV2S0103F DATE HAS INVALID MONTH: *date***

Explanation: The date specified in the license string is in an invalid format.

System response: XV2S Initialization fails. XV2S terminates.

User action: Correct the license string in the XV2S license string member and make sure the date is in the correct format.

## **XV2S0104F LICENSE STRING NOT IN HEX FORMAT: *licensestring***

Explanation: The license string specified in the license string is in an invalid format.

System response: XV2S Initialization fails. XV2S terminates.

User action: Correct the license string in the XV2S license string member and make sure the string is in the correct format, 28 Hexadecimal characters

**XV2S0105F    INVALID FEATURE: *feature***

Explanation:    The feature specified in the license string is incorrect for XV2S.  
System response:    XV2S Initialization fails. XV2S terminates.  
User action:    Correct the feature in the XV2S license string member and make sure the string is in the correct format, XPAF\_V2S.

**XV2S0106F    INVALID LICENSE STRING MEMBER.**

Explanation:    The license string member does not contain a recognizable license string,  
System response:    XV2S Initialization fails. XV2S terminates.  
User action:    Verify that the XV2S license string member, pointed to by the LICENSE DD card in the XV2S started task procedure, contains a valid license string. If so, contact Xerox technical support.

**XV2S0107F    LICENSE STRING CPUID DOES NOT MATCH: *cpuid***

Explanation:    The cpuid specified in the license string does not match the CPUID of the current system.  
System response:    XV2S Initialization fails. XV2S terminates.  
User action:    Correct the license string in the XV2S license string member and make sure it is the correct license string for this system.

**XV2S0110F    INPUT LICENSE FILE OPEN FAILURE**

Explanation:    XV2S was unable to open the license file dataset,  
System response:    XV2S Initialization fails. XV2S terminates.  
User action:    Verify that the XV2S license string member, pointed to by the LICENSE DD card in the XV2S started task procedure, contains a valid license string. If so, contact Xerox technical support.

**XV2S0111F    CORRECT JCL TO POINT TO LICENSE MEMBER**

Explanation:    XV2S was unable to open the license file dataset,  
System response:    XV2S Initialization fails. XV2S terminates.  
User action:    Verify that the XV2S license string member, pointed to by the LICENSE DD card in the XV2S started task procedure, contains a valid license string. If so, contact Xerox technical support.

**XV2S0112F    CSRSI - FAILED TO LOAD MODULE CSRSI**

Explanation:    XV2S was unable to load IBM module CSRSI in order to obtain the CPUID of the current system.  
System response:    XV2S Initialization fails. XV2S terminates.  
User action:    Contact Xerox Technical Support.

**XV2S0113F MEMORY ACQUISITION FAILURE**

Explanation: XV2S was unable to acquire storage for an internal work area.  
 System response: XV2S Initialization fails. XV2S terminates.  
 User action: Increase the region size available to the started task.

**XV2S0114F CORRECT JCL TO ENLARGE REGION SIZE**

Explanation: XV2S was unable to acquire storage for an internal work area.  
 System response: XV2S Initialization fails. XV2S terminates.  
 User action: Increase the region size available to the started task.

**XV2S0191F INVALID LICENSE: *licensestring***

Explanation: The license string in the license string member is incorrect.  
 System response: XV2S Initialization fails. XV2S terminates.  
 User action: Check the license string in the XV2S license string member and make sure it is the correct license string for this system.

**XV2S0192W WARNING: LICENSE EXPIRED ON *date*. *nn* DAYS LEFT IN GRACE PERIOD**

Explanation: The license string in the license string member has expired and the system is running in a 30 day grace period. XV2S will cease to work in nn days time  
 System response: Processing continues.  
 User action: Contact Xerox Technical support and make sure you have a new license before the grace period expires.

**XV2S0193F EMERGENCY LICENSE EXPIRED ON *date***

Explanation: The emergency license string in the license string member has expired.  
 System response: XV2S Initialization fails. XV2S terminates.  
 User action: Contact Xerox Technical support to obtain a new license string.

**XV2S0194F LICENSE EXPIRED ON *date*. GRACE PERIOD HAS EXPIRED**

Explanation: The license string in the license string member expired more than 30 days ago.  
 System response: XV2S Initialization fails. XV2S terminates.  
 User action: Contact Xerox Technical support to obtain a new license.

**XV2S0195W    WARNING: LICENSE WILL EXPIRE ON *date*. *nn* DAYS REMAINING**

Explanation:    The license string in the license string member is about to expire. It will  
expire in *nn* days time on *date*

System response:    Processing continues.

User action:    Contact Xerox Technical support and make sure you have a new license  
before the current license expires

**XV2S0196I    LICENSE WILL EXPIRE ON *date***

Explanation:    A valid license string has been found that will expire on the supplied date

System response:    Processing continues.

User action:    None

## XVW messages

---

### **XVW0724E** LDM ENCOUNTERED AN ERROR TRYING TO *activity*

- Explanation: The VTAM writer attempted to access the RMTTBL member in XINPARM, but encountered an error from LDM.
- System response: VTAM writer initialization fails. The printer is drained.
- User action: Refer to the preceding LDM error messages for more detailed information about the problem. Correct the error, then restart the printer.

### **XVW3010F** COULD NOT GET X'*storage size*' BYTES OF MEMORY *control block*

- Explanation: The VTAM writer could not allocate storage for the identified control block. Control block is one of these items:
- VTAM writer common area
  - RJE session control blocks
  - RJE remote table entry
  - RJE device chain entry
- System response: VTAM writer initialization fails. The printer is drained.
- User action: Specify a larger value for the REGION parameter in the XOSF start-up proc, then restart the printer.

### **XVW4004F** *module name* DETECTED AN INVALID *control block name* CONTROL BLOCK AT LOCATION X'*address*'

- Explanation: The VTAM writer determined that the named control block at the identified location was not valid or had been corrupted.
- System response: Document processing is terminated. The printer is drained.
- User action: Call Xerox Technical Support.

### **XVW4153E** MEMBER *member name* NOT FOUND IN LIBRARY *library name*

- Explanation: The VTAM writer attempted to access the member specified by the RMTTBL initialization parameter, but the member was not found.
- System response: VTAM writer initialization fails. The printer is drained.
- User action: Ensure that the member specified by the RMTTBL initialization parameter exists in XINPARM and contains the appropriate RJE definition statements. Restart the printer.

**XVW7009F** *module name* **RECEIVED AN INVALID FUNCTION REQUEST CODE.  
FUNCTION=C'command' OR X'command'**

Explanation: This is an internal error. This message may indicate incompatible communications specifications.

System response: Document processing is terminated. The printer is drained.

User action: If you are using either the 871 CM or BARR/SNA RJE to remotely attach a centralized printer to the host, ensure that the printer's profile specifies XNS=NO. In the printer's profile, the default is XNS=YES because centralized printers are normally channel-attached.

**XVW7301F** **CANNOT FIND DSC CONTROL TABLE** *table name*

Explanation: The load module containing the VTAM writer data stream integrity tables could not be located.

System response: VTAM writer initialization fails. The printer is drained.

User action: Call Xerox Technical Support.

**XVW7302F** **COULD NOT INITIALIZE VTAM EXITS. RC=X'return code'**

Explanation: The load module containing the VTAM exit routines could not be located.

System response: VTAM writer initialization fails. The printer is drained.

User action: Call Xerox Technical Support.

**XVW7303A** **INTERVENTION REQUIRED ON PRINTER** *printer name*

Explanation: The named printer returned an I/R response to a SEND function.

System response: The VTAM writer waits for a signal from the printer indicating that the I/R condition has been cleared. When the condition has been cleared, sending resumes.

User action: Resolve the I/R condition at the printer.

**XVW7304F** **CANNOT INITIALIZE PRINTER** *printer name* **BECAUSE VTAM IS NOT INITIALIZED**

Explanation: The named printer could not be initialized because the XOSF VTAM interface was not activated, possibly because an ACB name was not specified in the initialization parameters.

System response: The printer is drained.

User action: Ensure a VTAM ACB has been defined for XOSF and specified in the ACB initialization parameter in the XINSXOSF member of XINPARM. Restart the printer.

**XVW7305F    #WAKEUP COULD NOT BE PERFORMED FOR SHARED DEVICE. RC=X'***return code'*

Explanation:    The VTAM writer attempted to start a session with a printer that was already in session. A failure occurred when the VTAM writer attempted to set a timer to retry session start-up.

System response:    Document processing is terminated. The printer is drained.

User action:    Call Xerox Technical Support.

**XVW7306F    VTAM *function* ERROR OCCURRED *activity device-class device-name***

Explanation:    The indicated VTAM function ended in error. *Function* is one of these requests to VTAM:

- SIMLOGON
- OPNDST
- CLSDST
- SEND
- RECEIVE

*Activity*, which identifies what XOSF was attempting to do with the VTAM function, is one of these actions:

- while creating session (SIMLOGON)
- while binding session (OPNDST)
- while ending session (CLSDST)
- while sending data (SEND)
- while receiving data (RECEIVE)

*Device-class* is either PRINTER or REMOTE.

*Device-name* is the printer name or remote name.

System response:    If *device-class* is PRINTER, the indicated printer is drained. If *device-class* is REMOTE, the operation in progress at that remote is terminated. Message XVW7311F, which follows, provides more information about the failing VTAM function.

User action:    Retry the operation that caused the failure. If the failure persists, take the course of action appropriate to the return codes and sense codes presented in message XVW7311F.

**XVW7307F    NO SUPPORT FOR PRINTER COMMAND LANGUAGE *pcl type* THROUGH CONVERTER *converter type* IN *lu type* MODE**

Explanation:    The VTAM writer attempted to initialize a remotely-attached printer, but the printer's profile specified an unsupported combination of PCL, converter, and LU type.

Or, you have attempted to send a document type through a converter/LU type combination that cannot support the specified type of printer command language.

System response:    The printer is drained.

User action:    Ensure the printer is defined with the appropriate printer command language for the configuration you are using, then restart the printer.

**XVW7308F    COULD NOT** *activity* **ACB** *name*, **ERROR=X'***error code***'**

Explanation: During ACB OPEN/CLOSE processing, the indicated error was received by the VTAM writer.

System response: VTAM writer initialization fails. The printer is drained.

User action: If you have an OPEN error, look up the error code in the *VTAM Messages and Codes*. Check the ACB and XPSMAPPL initialization parameters to ensure they are defined, and match the VTAM definition.

**XVW7309F    COULD NOT GENERATE** *resource* **CONTROL BLOCK. RC=X'***vtam return code***'; IC=X'***information code***'**

Explanation: The VTAM GENCB macro returned an error while attempting to generate the named control block. *Resource* is either RPL or NIB.

System response: Document processing is terminated. The printer is drained.

User action: Return code errors are documented by IBM in the *VTAM Messages and Codes*. Look up the specified return code and take the necessary corrective action. Restart the printer.

**XVW7310F    COULD NOT LOCATE FSA GLOBAL DATA AREA FOR PRINTER** *printer name*

Explanation: This error occurs for printers participating in device sharing. For the named printer, the ECB used to retry device allocation could not be found.

System response: The printer is drained.

User action: Call Xerox Technical Support.

**XVW7311F    SLU=***slu name***, RTNCD-FDBK2=X'***rtncd-fdbk2' (rtncd-fdbk2 meaning)***, SENSE=X'***sense' (sense meaning)***'**

Explanation: This message may accompany message XVW7306F. It provides more information about the failing function.

System response: Document processing is terminated. The printer is drained.

User action: RTNCD-FDBK2 return code errors and sense codes are documented by IBM in the *VTAM Messages and Codes*. Look up the codes specified in the message and take the necessary corrective action. Restart the printer.

**XVW7312F    ERROR RECEIVED FROM SETLOGON FOR ACB** *acb name*.  
**RTNCD-FDBK2=X'***rtncd-fdbk2***', SENSE=X'***sense***'**

Explanation: The VTAM writer could not enable the indicated ACB for logons.

System response: VTAM writer initialization fails. The printer is drained.

User action: RTNCD-FDBK2 return code errors are documented by IBM in the *VTAM Messages and Codes*. Sense codes are documented in *SNA Formats*. Look up the codes specified in the message and take the necessary corrective action. Restart the printer.

**XVW7313F    PRINTER *printer name* IS PROFILED TO SUPPORT AN RJE PRINTER, BUT NO REMOTE ASSOCIATION EXISTS**

Explanation:    The VTAM writer attempted to initialize the named printer. The printer profile for this printer indicates that it operates under extended BARR/SNA RJE support; however, the RMTTBL member in XINPARM does not contain an association to this printer.

System response:    The printer is drained.

User action:    Use the SELECT keyword in the JES2 initialization statements within the RMTTBL member to supply the correct association from the RMTTBL to this FSA printer. Restart the printer.

**XVW7314F    PRINTER *printer name* IS PROFILED TO SUPPORT AN RJE PRINTER ON REMOTE *remote name* BUT *remote name* IS NOT ACTIVE**

Explanation:    The VTAM writer attempted to initialize the named printer. A RMTTBL association was found for this printer, but the remote workstation was not active.

System response:    The printer is drained.

User action:    Ensure that the XOSF address space is active. To do so, verify that at least one XOSF-controlled printer has been started. The started printer does not have to be a BARR/SNA RJE-attached printer. The next time the BARR/SNA RJE workstation attempts to log on to XOSF, all printers defined in the RMTTBL member in XINPARM will be started.

Do not start and stop FSA printers defined for extended BARR/SNA RJE support. These printers are started and stopped automatically when the workstation logs on and logs off.

**XVW7315I    REMOTE *remote name status product***

Explanation:    The named remote workstation system is either logging on to or logging off from XOSF.

System response:    If the remote workstation is logging on to XOSF, associated FSA printers are started. If the remote is logging off from XOSF, active associated FSA printers are drained.

User action:    None required.

**XVW7316E    COULD NOT ALLOCATE SESSION FOR RJE PRINTER *printer name***

Explanation:    XOSF attempted to perform document initialization for the named FSA printer, whose profile indicates it supports extended BARR/SNA RJE. The associated remote workstation was active, but no sessions were available for transmitting the current document.

System response:    Document processing is terminated, and the document is held on the JES spool.

User action:    XOSF creates control blocks for the number of supported sessions based on the NUMPRT and NUMRDR parameter values specified in the JES2 initialization statements in the RMTTBL member in XINPARM. Ensure that the number of sessions supporting this remote workstation is adequate.

**XVW7317E LOGON FROM REMOTE *remote name* IS REJECTED DUE TO *reason***

Explanation: An error occurred processing a remote logon. If *reason* is "UNKNOWN RMT," the remote name defined in the RMTTBL did not match the remote name from the logon. If *reason* is "INVALID PASSWORD," the password defined in the RMTTBL for the named remote did not match the password from the logon.

System response: The remote session is terminated.

User action: Ensure that the remote name or password specified in the RMTTBL member in XINPARM matches the remote name or password specified in the RJE Description in the BARR/SNA RJE software.

**XVW7318E PRINTER *printer name* DRAINED DUE TO LOST VTAM SESSION**

Explanation: The named printer was drained because its supporting VTAM session was terminated or lost.

System response: Processing for any document that was in transit to the printer is terminated. The document is requeued, and the printer is drained.

User action: Determine the cause of the lost VTAM session and take whatever action is needed to reestablish the session. Restart the printer to reestablish the session.

**XVW7319I PRINTER *printer name* IS BUSY**

Explanation: A document could not be sent to the named printer because the printer was busy processing another request.

System response: When the printer becomes available, the document will be transmitted.

User action: None required.

## XWR messages

---

**XWR0203E** **THM ERROR IN MODULE** *module name*. **CMD=***command*; **IC=X'***thm-information code*'; **RC=X'***thm-return code*'

Explanation: While attempting to process an XPAF VSAM dataset, an unexpected error was encountered. Other messages are usually issued along with this message to further identify the operation that failed.

System response: The current operation is terminated.

User action: Verify that all of the required XPAF libraries are present and not corrupted. If you believe you are receiving this message in error, call Xerox Technical Support.

**XWR1505E** *abend code* **ABEND**. **PSW=***pswdata*; **ILC=***instruction length code*; **INTC=***interrupt code*

Explanation: ESTAE processing has trapped an abend. Messages XWR1506E, XWR1507E, and XWR1508E further describe the abend.

System response: Document processing is terminated.

User action: Record all available information, including this and any other messages, and call Xerox Technical Support.

**XWR1506E** **ACTIVE LOAD MODULE=***module name*, **ADDRESS=***address*, **OFFSET=***offset*

Explanation: ESTAE processing has trapped an abend. This message identifies the load module, its load point, and the offset from the load point of the abending instruction.

System response: Document processing is terminated.

User action: Record all available information, including this and any other messages, and call Xerox Technical Support.

**XWR1507E** **DATA AT PSW ADDRESS,** *pswdata pswdata pswdata*

Explanation: ESTAE processing has trapped an abend. This message identifies the data at the abending instruction.

System response: Document processing is terminated.

User action: Record all available information, including this and any other messages, and call Xerox Technical Support.

**XWR1508E** *gpr register number, register number contents contents contents contents*

Explanation: ESTAE processing has trapped an abend. This message identifies the contents of the general purpose registers at the time of the abend.

System response: Document processing is terminated.

User action: Record all available information, including this and any other messages, and call Xerox Technical Support.

**XWR1601E** *module name* **RECEIVED AN INVALID PIPELINE CALL TYPE OF** *request*

Explanation: A pipeline processor passed a request through the pipeline that should have been made as a direct call. This is an internal error.

System response: Document processing is terminated.

User action: Call Xerox Technical Support.

**XWR3018E** **COULD NOT ACQUIRE TCB** *activity*. **THM RC=X'***return code'*

Explanation: This is an internal error.

System response: Document processing is terminated.

User action: Call Xerox Technical Support.

**XWR4354E** **CHECKPOINT (#CKPT) FAILED IN MODULE** *module name*

Explanation: Checkpoint processing failed for the document.

System response: Document processing is terminated.

User action: Call Xerox Technical Support.

**XWR7101E** *module name* **RECEIVED AN INVALID REQUEST OF** *invalid request*

Explanation: An incorrect function request was made to the named module. This is an internal error.

System response: Document processing is terminated.

User action: Call Xerox Technical Support.

**XWR7113E** **DEVICE DOES NOT USE XNS. REQUEST=***request*

Explanation: XOSF attempted to send an XNS document to a printer that is not running in XNS mode.

System response: Document processing is terminated.

User action: Restart the printer in XNS mode. If the problem persists, call Xerox Technical Support.

**XWR7114E** **NO OUTPUT DEVICE DEFINED FOR DOCUMENT. REQUEST=***request*

Explanation: No physical device is available for this document. In the printer's profile, either no value was specified for the WRITER parameter for a centralized printer or WRITER=(REMOTE,ONLY) was specified for a decentralized printer.

System response: Document processing is terminated.

User action: Verify that the WRITER printer profile parameter specifies either a valid printer name or the file or DISK option. Or, add the OPWRITER parameter to the JCL of the failing job.

**XWR7115E    PREVIOUS FILING REQUEST NOT COMPLETE. REQUEST=*request***

Explanation:    The XNS filing request was not completed before another XNS request was made. This is an internal error.

System response:    Document processing is terminated.

User action:    Call Xerox Technical Support.

**XWR7116E    XFDB ADDRESS IS ZERO FOR REQUEST=*request***

Explanation:    A pipeline processor made a PUT request without supplying the address of the XFDB. This is an internal error.

System response:    Document processing is terminated.

User action:    Call Xerox Technical Support.

**XWR7117E    XNS IS OFF FOR THIS DOCUMENT. REQUEST=*request***

Explanation:    An XNS filing request was made for a document that is not using XNS. This is an internal error.

System response:    Document processing is terminated.

User action:    Call Xerox Technical Support.

**XWR7118E    OUTPUT TO FILE/DISK ERROR. REQUEST=*request***

Explanation:    An error occurred while trying to write to a file or disk dataset. To determine the exact cause of the error, see the explanation for the XTW message(s) issued along with this message.

System response:    Document processing is terminated.

User action:    See the user action for the accompanying XTW message(s).

**XWR7119E    INVALID XPPDRQ REQUEST BLOCK**

Explanation:    A pipeline component made a direct call to XWR with an invalid request control block. This is an internal error.

System response:    Document processing is terminated.

User action:    Call Xerox Technical Support.

**XWR7120E    GETFILE INPUT AREA TOO SMALL FOR XNS FILE TRANSFER**

Explanation:    A pipeline component made a direct call to XWR for a file transfer but did not supply a large enough input area.

System response:    Document processing is terminated.

User action:    Call Xerox Technical Support.

**XWR7121E LISTFILE INPUT AREA TOO SMALL FOR XNS RETRIEVAL**

Explanation: A pipeline component made a direct call to XWR for a file directory list but did not supply a large enough input area. This is an internal error.

System response: Document processing is terminated.

User action: Call Xerox Technical Support.

**XWR7122E PUTFILE AREA NOT GIVEN FOR XNS FILE TRANSFER**

Explanation: A pipeline component made a direct call to XWR for a file transfer but did not supply an output file area address. This is an internal error.

System response: Document processing is terminated.

User action: Call Xerox Technical Support.

**XWR7123E DDNAME=*ddname*, LIST=*list name***

Explanation: A THM error has occurred. This message supplies additional information about the file being processed when the error occurred. The actual error is identified in message XWR7403E.

System response: Document processing is terminated.

User action: If possible, correct the problem. If the problem persists, call Xerox Technical Support.

**XWR7202E COULD NOT GET SUFFICIENT MEMORY *activity***

Explanation: A get memory request failed.

System response: Document processing is terminated.

User action: Call Xerox Technical Support.

**XWR7402E ERROR CREATING XNS PROTOCOL TO *activity file name* FILE**

Explanation: An error occurred while initializing the printer. The correct file handle was not available.

System response: Document processing is terminated.

User action: Drain and restart the printer. The file handles are established during printer initialization.

**XWR7403E RESPONSE FROM DEVICE = *response*. REASON CODE=*reason code activity***

Explanation: The printer responded to an XNS procedure with an unexpected response.

System response: Document processing is terminated.

User action: Determine the problem (usually at the printer) from the text of the message.

**XWR7404E**    **FILE=***file*, **DIR=***directory*

Explanation:    An XNS filing request was terminated by the printer. This message supplies additional information about the file being processed when the error occurred. The actual error is identified by XWR7403E.

System response:    Document processing is terminated.

User action:    If possible, correct the problem. If the problem persists, call Xerox Technical Support.

## XXQ messages

---

### **XXQ3010E    COULD NOT GET *number of bytes* BYTES OF MEMORY WHILE BUILDING PAL**

- Explanation:    XOSF could not acquire the necessary bytes of memory while building the PAL. There is a shortage of storage in the XPAF address space.
- System response:    Document processing is terminated, and the document is requeued on the JES spool.
- User action:    Shut down XPAF, then rerun it with a larger REGION size.

### **XXQ3011E    COULD NOT RELEASE *number of bytes* BYTES OF MEMORY FROM LOCATION X'address' WHILE BUILDING PAL**

- Explanation:    After processing a document, XOSF attempted to release storage that it acquired for the PAL. However, XOSF encountered an error when trying to return the storage to the Free Storage Segment Block.
- System response:    Document processing is terminated, and the document is requeued on the JES spool.
- User action:    Call Xerox Technical Support.

### **XXQ3610E    PAL PROCESSOR *processor name* IS UNDEFINED. PAL BUILDING ABORTED**

- Explanation:    XOSF could not construct the PAL for this document or device type because a PAL processor called by the PAL#XPAF table is not defined in the processor table (XOSFXPAF) that was loaded by system initialization.
- System response:    Document processing is terminated, and the document is requeued on the JES spool.
- User action:    Call Xerox Technical Support.

### **XXQ3611E    PAL PROCESSOR *processor name* IS MISSING. PAL BUILDING ABORTED**

- Explanation:    XOSF could not construct the PAL for this document or device type. A PAL processor that was called by the PAL#XPAF table is defined in the processor table (XOSFXPAF) but was not loaded during system initialization.
- System response:    Document processing is terminated, and the document is requeued on the JES spool.
- User action:    Ensure no errors occurred during system initialization, then call Xerox Technical Support.

**XXQ3612E CANNOT FIND SUPPORTING PAL FOR DOCUMENT TYPE *document type* AND PRINTER COMMAND LANGUAGE *pcl type***

- Explanation: The *document type* and *pcl type* combination does not have a corresponding entry in the PAL. One of these conditions exists:
- The printer does not support the type of document. For example, you cannot send an XES document to a 9700 printer.
  - The printer supports multiple command languages, but the document being printed is not valid for the PCL printer profile parameter setting.

*Document type* can be one of the following:

- AFPX(Page-formatted to Metacode)
- AFPA(AFP to Metacode)
- DJDE(Dynamic Job Descriptor Entry)
- JCL(XPAF extended JCL)
- NM(Line-mode)
- XES(Xerox Escape Sequence)

*pcl type* can be one of the following:

- DJDE
- META
- PCL
- XES

System response: Document processing is terminated, and the document is requeued on the JES spool.

User action: Verify that the printer can support the document type you are trying to print. If the printer supports multiple command languages, make sure the PCL printer profile parameter is set correctly for the printer and the type of documents you are trying to print.

# *Section Seven: XPAF Operator Guide*

This section describes the JES2, JES3, XPAF-exclusive, and XDS-exclusive operator commands that host console operators are likely to use when printing with XPAF. Read this section if you are a console operator, system administrator, systems programmer, or anyone else who uses XPAF operator commands.

Before you begin to use XPAF's operator commands, verify that XPAF has been installed and that the installation verification procedures (IVPs) can be run successfully.

As a user of XPAF's operator commands, ensure that printers have been set up correctly and are using the proper switch settings.

## 46. JES2 printer commands

XPAF recognizes most standard IBM JES2 commands and their uses. You can enter JES2 commands from the operator console to perform many functions, including:

- Starting a printer
- Halting a printer
- Stopping or draining a printer
- Restarting a printer
- Interrupting a printer
- Displaying a printer's status
- Setting printer characteristics
- Retransmitting a document
- Releasing a print job from the JES queue
- Canceling a document being transmitted from JES

Only printer-related JES2 commands that are supported by XPAF are described in this chapter. When you enter these commands, *nnnn* refers to the printer ID number unless otherwise specified. For information about other JES2 commands not listed in this chapter, refer to the appropriate IBM z/OS JES2 commands publication.

When working in a TCP environment, you must issue an LPR command instead of certain printer commands, like CANCEL and RESTART. Refer to your vendor's TCP documentation for valid command syntax.

### Starting a printer

---

If XOSF is not currently active, this command starts XOSF from a cataloged procedure.

**Syntax**     \$S PRT $nnnn$

**Example**     \$S PRT1900

**Message issued**     The console displays a message similar to this:

XDI3423I     (PRT1900) FSA CONNECTED TO JES

**Related information**     For centralized printers, JES issues the \$HASP190 SETUP message if you specify SETUP=Y in the initialization parameters and/or printer profile parameters under either of these circumstances:

- In response to the \$S PRT $nnnn$  command
- When a FORMS change is encountered in the JCL

The JES message looks similar to this:

\$HASP190     XPAFJOB     SETUP - PRT01 - F = STD

To continue, issue the \$S PRT $nnnn$  command.

## Halting a printer

---

After you issue this command, no other transmission is scheduled for this printer.

**Syntax**     \$Z PRT $nnnn$

**Example**     \$Z PRT1900

**NOTE:** If you issue a start printer command (\$S PRT $nnnn$ ), transmission resumes at the point where the document was halted.

---

**Messages issued**     The console displays standard JES messages.

## Stopping or draining a printer

---

This command stops the printer after JES finishes transmitting the current document. However, this command does not affect other printers and does not stop XOSF processing.

**Syntax**     \$P PRT $nnnn$

**Example**     \$P PRT1900

**Messages issued**     The console displays messages similar to these:

XDI3449I     FSA HAS BEEN REQUESTED TO TERMINATE FOR (PRT1900)

XDI3435I     FSA DISCONNECTING FOR DEVICE (PRT1900)

## Restarting a printer

---

The point at which a document resumes printing when a printer is restarted is dependent on the document and printer type. XPAF supports a checkpoint restart for DJDE, page-formatted, and AFP documents directed to centralized, decentralized, and PCL-capable printers. Processing resumes from the most recent checkpoint as specified by the CKPTPAGE IBM JCL keyword. For more information on checkpoint restart processing, refer to [Section Four: Printing Documents with XPAF](#).

XPAF only supports the CKPTPAGE option for checkpoint restart. Review the CKPTPAGE JES printer definition parameter and/or the CKPTPAGE IBM JCL keyword for the checkpoint interval setting for your printer and/or document. For more information on the CKPTPAGE IBM JCL keyword, refer to [Section Five: XPAF Parameter and Keyword Reference](#).

**Syntax**     \$S PRT $nnnn$

**Example**     \$S PRT1900

**Message issued**     The console displays a message similar to this:

XDI3423I     (PRT1900) FSA CONNECTED TO JES

## Displaying a printer's status

The operands available for this command are described in the appropriate IBM z/OS JES2 commands publication.

**Syntax** \$DU,PRT $nnnn$

**Example** \$DU,PRT1900

**Messages issued** The console displays standard JES messages.

## Setting printer characteristics

JES2 accepts this command and makes the appropriate changes to the printer's setting. The new setting remains in effect until the printer is restarted or the characteristics are changed again. The various operands available for this command are described in the appropriate IBM z/OS JES2 commands publication.

**Syntax** \$T PRT $nnnn$ ,operand(s)

**Example** \$T PRT1900,F=STD1

**Messages issued** The console displays standard JES messages.

**Related information** When entering the setting printer characteristics command for printers in XPSC-compatibility mode, the following operands apply:

| Operand                                                                        | Result                                                                          |
|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| F=forms                                                                        | This value is passed to the XPSM server.                                        |
| MODE=FSS                                                                       | This value must be FSS.                                                         |
| PLIM= $\left\{ \begin{array}{c} m \\ m-n \\ m-* \end{array} \right\}$          | This value is not used by XPAF, but does have an effect on JES2 job scheduling. |
| Q=c1[...c15]                                                                   | This value is the number of copies, and is passed to the server.                |
| SEP= $\left\{ \begin{array}{c} \text{YES} \\ \text{NO} \end{array} \right\}$   | This value is used to generate banner pages between jobs.                       |
| SEPDS= $\left\{ \begin{array}{c} \text{YES} \\ \text{NO} \end{array} \right\}$ | This value is used to generate banner pages between datasets.                   |

**NOTE:** Using other operands when in XPSC-compatibility mode may cause unpredictable results. These operands are described in the appropriate z/OS JES2 commands publication.

## Interrupting a document

---

This command stops current printing and requeues the untransmitted portion of the document to the JES spool.

**Syntax**     \$I PRT $nnnn$

**Example**     \$I PRT1900

**Messages issued**     The console displays messages similar to these:

```
XDI3419I PRT1900 JOB2613 SYSUT2 IMPRESSIONS=1 PAGES=1 ETIME=.4
XDI3484E JOB JOBAA99999 JOB25932 STEP GO DDNAME SYSUT2 ON PRT1900
 INCOMPLETE AND REQUEUED
XSL720EI JOB25941 JOBCA3965 PRINTING INTERRUPTED BY OPERATOR
```

## Restarting a document

---

This command restarts the printer from the beginning of the document.

**Syntax**     \$E PRT $nnnn$

**Example**     \$E PRT1900

**Messages issued**     The console displays messages similar to these:

```
XDI3419I PRT1900 JOB2613 SYSUT2 IMPRESSIONS=1 PAGES=1 ETIME=.4
XSL720EI JOB25941 JOBCA3965 PRINTING RESTARTED BY OPERATOR
```

## Backspacing a document

---

This command backspaces a document the number of pages specified.

**Syntax**     \$B PRT $nnnn$ , $pages$

where

$nnnn$  is the printer ID number.

$pages$  is the number of pages to backspace a document.

**Example**     \$B PRT1900,16

**Messages issued**     The console displays standard JES messages.

```
XSL720EI JOB25941 JOBCA3965 PRINTING BACKSPACED BY OPERATOR
XCC6422I PRT1900 BACKSPACED TO PAGE 20
```

## Forward spacing a document

---

This command forward spaces a document the number of pages specified.

**Syntax**    \$F PRT $nnnn$ , $pages$

where

$nnnn$  is the printer ID number.

$pages$  is the number of pages to forward space a document.

**Example**    \$F PRT1900,16

**Messages issued**    The console displays standard JES messages.

XSL720EI    JOB25941 JOB3A3965 PRINTING FORWARD SPACED BY  
OPERATOR

XCC6422    PRT1900 FORWARD SPACED TO PAGE 20

## Retransmitting a document

---

This command signals JES to retransmit the document from the JES spool, starting with page one, when the current copy is printed.

Wait until the initial copy of the document has begun printing before issuing this command.

**Syntax**    \$N PRT $nnnn$

**Example**    \$N PRT1900

**Messages issued**    The console displays standard JES messages.

## Releasing a print job from the JES queue

---

After you issue this command, a job can be rescheduled for printing.

**Syntax**    \$O J $nnnnn$

where

$nnnnn$  is the job number.

**Example**    \$O J51422

**Messages issued**    The console displays standard JES messages.

## Canceling a document being transmitted from JES

---

This command cancels the document being transmitted from JES.

---

**NOTE:** With buffered devices, it may be difficult to determine the point of cancellation.

---

**Syntax**     \$C PRT $nnnn$

**Example**     \$C PRT1900

**Message issued**     The console displays a message similar to this:

XSL720EI     JOB25941 JOBRK54486 PRINTING CANCELED BY OPERATOR

## 47. JES3 printer commands

XPAF recognizes most standard IBM JES3 commands and their uses. You can enter JES3 commands from the operator console to perform many functions, including:

- Starting an XPAF FSS for JES3
- Starting a printer
- Terminating a printer
- Interrupting and retransmitting a document
- Canceling output
- Querying JES3 for job information

Only the printer-related JES3 commands that are supported by XPAF are described in this chapter. For information about other JES3 commands not listed in this chapter, refer to the appropriate IBM z/OS JES3 commands publication.

When you enter these commands, *device-name* is the printer designated in the initialization stream. For XPAF, always assign a printer as the device.

When working in a TCP environment, you must issue an LPR command instead of certain printer commands, like CANCEL and RESTART. Refer to your vendor's TCP documentation for valid command syntax.

### Starting an XPAF FSS for JES3

---

These commands cause JES3 to call an output writer. This output writer controls the XPAF FSS, which in turn controls the specified printer.

An XPAF printer should be run as a JES3 hot writer.

**Syntax**    \*CALL,WTR,OUT=*device-name*,NAV=R  
or  
              \*X,WTR,OUT=*device-name*,NAV=R

**Example**    \*CALL,WTR,OUT=PRT1900,NAV=R

**Messages issued**    The console displays standard JES messages.

## Starting a printer

---

This command starts a printer associated with the XPAF FSS.

**Syntax** \*VARY,*device-name*,ONLINE

**Example** \*V,PRT1900,ON

**Messages issued** The console displays messages similar to these:

XIN0015I XPAF V3R0 INITIALIZATION COMPLETE

XDI3402I XP59 XOSF FSS CONNECTED TO JES3

XDI3423I PRT1900 FSA CONNECTED TO JES3

## Terminating a printer

---

Any of these commands terminates the printer and the specified FSS after the current activity is finished.

**Syntax** \*CALL,WTR,OUT=*device-name*,T

\*X,WTR,OUT=*device-name*,T

\*START,*device-name*,T

\*RESTART,*device-name*,T

\*CANCEL,*device-name*,T

**Example** \*S,PRT1900,T

**Messages issued** The console displays messages similar to these:

XDI3435I FSA DISCONNECTING FOR DEVICE (PRT1900)

XDI3405I XP59 XOSF ADDRESS SPACE ENDING

## Interrupting and retransmitting a document

---

You can use any of several JES3 \*RESTART command options to stop and restart document transmission to a specified printer. XPAF supports a checkpoint restart for DJDE, page-formatted, and AFP documents directed to centralized, decentralized, PCL-capable printers and when converting to PDF. Processing resumes from the most recent checkpoint as specified by the CKPTPAGE IBM JCL keyword. For more information on checkpoint restart processing, refer to [Section Four: Printing Documents with XPAF](#).

XPAF only supports the CHKPTPAGE option for checkpoint restart. Review the CKPTPAGE JES printer definition parameter and/or the CKPTPAGE IBM JCL keyword for the checkpoint interval setting for your printer and/or document. For more information on the CKPTPAGE IBM JCL keyword, refer to [Section Five: XPAF Parameter and Keyword Reference](#).

**Syntax**     
$$*RESTART, device-name, \left\{ \begin{array}{c} N \\ C \\ J \end{array} \right\}$$

where

- N   Halts the current document transmission and requeues it for subsequent transmission.
- C   Halts the current transmission and restarts printing the document from the last checkpoint.
- J   Halts the current transmission and requeues all completed datasets to JES3 for rescheduling.

**Example**     \*R,PRT1900,N

**Messages issued**     The console displays messages similar to these:

```
XDI3419I PRT1900 JOB2613 SYSUT2 IMPRESSIONS=1 PAGES=1 ETIME=.4
XDI3484E JOB JOBAA99999 JOB25932 STEP GO DDNAME SYSUT2 ON PRT1900
 INCOMPLETE AND REQUEUED
XSL720EI JOB25941 JOBCA3965 PRINTING INTERRUPTED BY OPERATOR
```

## Backspacing or forward spacing a document

---

These commands backspace and forward space a document the number of pages specified.

**Syntax**     \*RESTART,*device-name*,R= $\left\{ \begin{array}{l} -nnnnP \\ nnnnP \end{array} \right\}$

where

*device-name*     The printer designated in the initialization stream.

-nnnnP             Backspaces a document the number of pages specified.

nnnnP             Forward spaces a document the number of pages specified.

**Example**        \*R,PRT1900,R=-16P

**Messages issued**     The console displays messages similar to these:

XSL720EI     JOB25941 JOBCA3965 PRINTING BACKSPACED BY OPERATOR

XCC6422I     PRT1900 BACKSPACED TO PAGE 20

## Canceling output

---

When this command is issued, the document which is being transmitted is canceled, not the document which is currently printing.

**Syntax**        \*CANCEL,*device-name*

**Example**        \*C,PRT1900

**Message issued**     The console displays a message similar to this:

XSL720EI     JOB25941 JOBCA3965 PRINTING CANCELED BY OPERATOR

## Querying JES3 for job information

---

These commands display information about jobs in the output service writer queue.

**Syntax** • To display information about output datasets, enter this command:

`*INQUIRY,U,Q=WTR,parms`

• To display job status information, enter this command:

`*INQUIRY,J=`  $\left\{ \begin{array}{l} \textit{job-name} \\ \textit{job-number} \end{array} \right\}$

• To display device status information, enter this command:

`*INQUIRY,D,D=device-name`

**Example** `*I,D,D=PRT1900`

**Messages issued** The console displays standard JES messages.

## 48. XPAF-exclusive operator commands

In addition to the standard IBM JES2 and JES3 commands, you also can use a set of unique XPAF operator commands to control printer-related functions. These XPAF-exclusive commands operate as options of the z/OS MODIFY command.

From the operator console, you can enter XPAF-exclusive commands to perform many functions, including:

- Displaying the subsystem name for an XOSF started task
- Displaying the status of active print jobs
- Displaying the status of active tasks
- Terminating an individual task on the printer
- Terminating the XPAF FSS
- Forcing the XOSF address space to terminate
- Turning SMF recording on and off
- Turning z/OS system logging on and off
- Turning XOSF logging on and off
- Refreshing the XLOG dataset
- Switching the XLOG to an alternate dataset
- Displaying the active XLOG
- Turning intensive logging on and off
- Enabling/Suppressing messages

The functions and their related operator commands are discussed in this chapter.

### Displaying the subsystem name for an XOSF started task

This command displays the subsystem name for a task started by XOSF.

**Syntax**     MODIFY *xosf-jobname*, DISPLAY { SUBSYS  
                                                SID }

**Example** F XP59,DIS SUBSYS

**Message issued** When you execute either of these commands, the console displays a message similar to this:

XDI3499I XPAF5 SUBSYSTEM NAME: XPF5

where

XPAF5 is the procedure name of the started task, and XPF5 is the subsystem name specified for XOSF in the SUBSYS initialization parameter. Each active XOSF is assigned a unique name. For more information about the SUBSYS initialization parameter, refer to [Section Five: XPAF Parameter and Keyword Reference](#).

## Displaying the status of active print jobs

This command displays the status of an XOSF print job from the operator console.

**Syntax**     `MODIFY xosf-jobname,DISPLAY ACTIVE JOBS`

**Example**     `F XP59,DIS ACT JOB`

**Messages issued**     The console produces a display similar to this:

```

XDI3460I TASK-ID DOCUMENT-ID TOT-REC PR-REC T-PAGE P-PAGE
XDI3460I PRT15 JOB 2258LINEMODE 120 97 0 2
XDI3460I PRT16 *INACTIVE*
XDI3460I PRT17 JOB 2260AFPMODE 0 141 9 7
XDI3460I DISPLAY ACTIVE JOBS COMMAND COMPLETED

```

where

|             |                                                                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASK-ID     | The name of the printer to which the job was sent.                                                                                                                             |
| DOCUMENT-ID | The 16-character document identifier that consists of the job number and the job name. If no document is being processed, this field indicates that the printer is inactive.   |
| TOT-REC     | The total number of records as reported by JES. Table 48-1 describes the contents of this field for line-mode and page-formatted jobs processed in JES2 and JES3 environments. |
| PR-REC      | The number of records sent to the printer.                                                                                                                                     |
| T-PAGE      | The total number of pages as reported by JES. Table 48-1 describes the contents of this field for line-mode and page-formatted jobs processed in JES2 and JES3 environments.   |
| P-PAGE      | The number of pages sent to the printer.                                                                                                                                       |

Table 48-1. TOT-REC and T-PAGE values reported by JES

| Subsystem | Job mode       | Message field            |                                                     |
|-----------|----------------|--------------------------|-----------------------------------------------------|
|           |                | TOT-REC                  | T-PAGE                                              |
| JES2      | Line-mode      | Actual number of records | Always 0                                            |
|           | Page-formatted | Actual number of records | The number of BEGIN PAGE structured fields (D3A8AF) |
| JES3      | Line-mode      | Always 0                 | Always 0                                            |
|           | Page-formatted | Always 0                 | The number of BEGIN PAGE structured fields (D3A8AF) |

## Displaying the status of active tasks

This command displays the status of an XOSF task from the operator console.

**Syntax**     `MODIFY xosf-jobname,DISPLAY ACTIVE TASKS`

**Example**     `F XP59,DIS ACT TASK`

**Messages issued**     The console produces a display similar to this:

```

XDI3460I TASK-# TASK-ID TYPE CUU/SLU DOCUMENT-ID STATUS
XDI3460I 000003 *SYSTEM* WAIT
XDI3460I 000004 *SYSTEM* WAIT
XDI3460I 000005 *SYSTEM* WAIT
XDI3460I 000006 *SYSTEM* WAIT
XDI3460I 000007 PRT1051 4850 025T2A01 *INACTIVE* WAIT
XDI3460I 000008 PRT1451 4850 025T2A02 JOB16101USERJOB1 WAIT
XDI3460I 000009 PRT3351 XPSM 025T2A03 JOB16101USERJOB1 WAIT
XDI3460I 000010 PRT2051 4850 *INACTIVE* WAIT
XDI3460I 000011 PRT2451 4850 0E23 *INACTIVE* WAIT
XDI3460I DISPLAY ACTIVE TASK COMMAND COMPLETED

```

where

**TASK-#**     The internal number assigned to this task.

**TASK-ID**     The name of the task that is running.

**TYPE**     The type of printer.

**CUU/SLU**     CUU is the channel address of a centralized printer. SLU identifies the network name of the printer. If you are printing to file or to a centralized disk printer, this field remains blank.

When entering the display active task command, the console may show the SLU for all XPSM-attached centralized printers, as well as the CUU for all locally-attached centralized printers.

**DOCUMENT-ID**     The 16-character document identifier which consists of the job number and the job name. If a system task is displayed, this space is blank. If no document is being processed, this field indicates that the printer is inactive.

**STATUS**     Indicates the processing status of the listed task.

XOSF operates in a multitasking environment. This can put heavy demands on available resources. The STATUS indicator shows the status of the task with regard to available resources:

- WAIT indicates that the task is waiting for an event or resource.
- LOCK indicates that the task is currently controlling a resource.
- WAIT — LOCK indicates the task is waiting for a resource that is currently being used by another task.

A task that remains in a WAIT or LOCK state for several minutes may indicate an internal problem. First check the printer and ensure it is in working order. If nothing is printing, terminate the individual task and call Xerox Technical Support.

## Terminating an individual task on the printer

---

This command terminates an individual task.

**Syntax**    `MODIFY xosf-jobname,TERMINATE TASK taskid`

where

*taskid* is the number assigned to the task as indicated in the active tasks display. This command immediately terminates the specified task.

**Example**    `F XP59,TERM TASK 63`

**Message issued**    The console displays a message similar to this:

XDI3516I    XOSF TERMINATE TASK REQUEST COMPLETED

**CAUTION:** Using this command is a drastic measure. It immediately halts the thread that is processing the documents being sent to the printer and stops the printer.

After this command has been issued, XPAF will be in an unstable state. You should shut down the FSS as soon as possible after the TERM TASK command is issued.

---

**NOTE:** When you try to restart a decentralized or PCL-capable printer, a series of VTAM-related error messages may be displayed. Issue the VTAM TERM command to terminate the session that is still active. If this does not work, refer to the appropriate VTAM operation manual for more information on restarting the printer.

---

## Terminating the XPAF FSS

---

This command shuts down the system and terminates all tasks in progress.

**Syntax**     `MODIFY xosf-jobname,SYSTEM SHUTDOWN`

You can also use the standard z/OS STOP command:

`STOP xosfid`

**Example**     `F XP59,SYS SHUTDOWN`

**Messages issued**     The console displays messages similar to these:

XDI3501I     XOSF SHUTTING DOWN

XDI3405I     XP59 XOSF ADDRESS SPACE ENDING

If you use this command, active printers are displayed, and this message asks you to confirm shutdown:

XDI3504A     CONTINUE WITH XOSF SHUTDOWN?    REPLY Y OR N

The system does not process further print requests until you reactivate the FSS by issuing a JES start printer command (`$S PRTnnnn`) from the operator console.

**Related information**

If you are running z/OS version 4.3.0 or higher, the IEF352I Address Space Unavailable message may be issued for informational purposes when XPAF is shut down. For information about this message, refer to IBM publication *z/OS System Messages, Vol. 4 (IEC-IFD)*.

To circumvent the problem indicated by the IEF352I message, change the values for the parameters MAXUSER, RSVSTRT, and RSVNONR in SYS1.PARMLIB(IEASYSxx). For more information, refer to [Section Two: Installing and Customizing XPAF](#).

## Forcing the XOSF address space to terminate

---

This command terminates all FSAs. There are no message responses from the system; use this command only in error situations.

**Syntax**     `MODIFY xosf-jobname,FORCE`

**CAUTION:** Using this command is a drastic measure. It immediately halts the address space and any threads from that address space.

---

**Example**     `F XP59,FORCE`

**Related information**     If you are running z/OS version 4.3.0 or higher, the IEF352I Address Space Unavailable message is issued for informational purposes every time XPAF is terminated. If one or more of the following situations applies, you must either bring down JES or IPL the system to free the unavailable address space slots in the z/OS address space vector table:

- No new started tasks can be started.
- No new batch initiators can be started.
- No additional users can use their TSO logons.

To avoid this problem, change the values for the parameters MAXUSER, RSVSTRT, and RSVNONR in SYS1.PARMLIB(IEASYSxx). For more information, refer to [Section Two: Installing and Customizing XPAF](#).

## Turning SMF recording on and off

XPAF fully supports IBM's SMF recording capability. The information in SMF records can be used to analyze workloads or profile system resource use. By keeping historical SMF data and studying its trends, you can evaluate changes in the configuration, workload, or scheduling at your installation.

This command also enables or disables SMF recording if you are running XPAF in XPSC-compatibility mode or XPAF full-client mode. For further information on SMF recording for XPSM, refer to the XPSM user documentation.

For TCP printing, you may see differences in your SMF statistics because your SMF records will reflect job creation information about the TCP dataset instead of actual printing information. For example, the SMF record will be updated even if the job did not print. Refer to [Section Two: Installing and Customizing XPAF](#) for more information about TCP printing in XPAF.

[illegible]

**NOTE:** If you specified SMF=Y in the initialization parameters, XPAF automatically generates SMF records. If you specified XPSMBRS=Y and/or XPSMSRS=Y in the initialization parameters, XPAF automatically generates XPAF and/or XPSM SMF records.

**Example** F XP59,SET SMF REC ON

**Messages issued** The console displays messages similar to these:

XDI3514I XOSF SYSTEM SMF RECORDING TURNED ON

XDI3514I XOSF SYSTEM SMF RECORDING TURNED OFF

## Turning z/OS system logging on and off

XPAF can write its messages to the z/OS system log. You can include both XOAF and XOSF messages in the log if you specify it in the initialization parameters or the XOSF start-up proc. Otherwise, only essential XPAF messages are written to the system log. For information on setting up your logging, refer to [Section Two: Installing and Customizing XPAF](#).

**Syntax**    `MODIFY xosf-jobname,SET SYSTEM LOGGING { ON  
OFF }`

**Example** F XP59,SET SYS LOG ON

**Messages issued** The console displays messages similar to these:

XDI3500I XOSF SYSTEM LOGGING TURNED ON

XDI3500I XOSF SYSTEM LOGGING TURNED OFF

## Turning XOSF logging on and off

XPAF writes XOSF messages to an XLOG file. Because some of the same information is collected by both XLOG and the SYSLOG functions, select the method that works best for your installation. To separate XOSF system information from the main system log, enable XOSF logging.

**Syntax**    MODIFy *xosf-jobname*,SET XOSF LOGGING { ON }  
                                                { OFF }

**NOTE:** Logging cannot be enabled unless a log dataset has been allocated and printed to by the XLOGDSN initialization parameter.

**Example** F XP59,SET XOSF LOG ON

**Messages issued** The console displays messages similar to these:

XDI3480I LOGGING HAS BEEN ENABLED TO MJONES.XPAF30.XLOG

XDI3481I LOGGING HAS BEEN DISABLED TO MJONES.XPAF30.XLOG

For information on setting up and managing logs, refer to [Section Two: Installing and Customizing XPAF](#).

## Refreshing the XLOG dataset

This command forces any messages that have been issued by XOSF to be written to the XOSF log dataset, so that you can browse the XOSF log dataset while XOSF is active and without setting logging off. It ensures that you are browsing the most current XOSF log.

**Syntax**    `MODIFY xosf-jobname,REFRESH XLOG`

**Example** F XP59,REF XLOG

**Message issued** The console displays a message similar to this:

XDI3461I XOSF XLOG=RBLACK.XPAF30.XLOG HAS BEEN REFRESHED

## Switching the XLOG to an alternate dataset

---

This command switches logging from the primary XLOG dataset to an alternate dataset. To use an alternate dataset, you must include its name in the ALOGDSN initialization parameter. The alternate dataset must be empty or contain only one record. This requirement prevents you from switching to a dataset that is not archived and/or cleared.

If XPAF issues messages indicating that either the primary or alternate log dataset is full, you must clear the dataset. If you want to keep a record of the messages, print or archive the dataset before clearing it.

For information about setting and clearing log files, refer to [Section Two: Installing and Customizing XPAF](#).

**Syntax**      `MODIFY xosf-jobname,SWITCH XLOG`

**Example**      `F XP59,SWI LOG`

**Message issued**      The console displays a message similar to this:

```
XDI3549I THE LOG DSNAME WAS SWITCHED FROM XPAF30.XOSFLOG TO
 XPAF30.XOSFLOG2
```

## Displaying the active XLOG

---

This command displays the names of the primary and alternate XOSF log datasets.

**Syntax**      `MODIFY xosf-jobname,DISPLAY ACTIVE XLOG`

**Example**      `F XP59,DIS ACT LOG`

**Messages issued**      The console displays messages similar to these:

```
XDI3470I CURRENT XLOG DSNAME=RBLACK.XPAF30.XLOG
XDI3471I ALTERNATE XLOG DSNAME=RBLACK.XPAF30.XLOG2
XDI3467I LOGGING IS ACTIVE TO XPAF30.XLOG
```

## Turning intensive logging on and off

---

As a diagnostic aid, you can turn the intensive logging indicator on or off:

- When the indicator is turned on, debugging messages or additional information messages are written to the XOSF log dataset. For this reason, you may want to turn on intensive logging when debugging a problem.
- When the indicator is turned off, additional messages are not written to the XOSF log dataset.

**Syntax**      `MODIFY xosf-jobname,SET INTENSIVE LOGGING { ON  
OFF }`

**Example**      `F XP59,SET INT LOG ON`

**Messages issued**      The console displays messages similar to these:

MSF8011I    INTENSIVE LOGGING INDICATOR SET ON

MSF8012I    INTENSIVE LOGGING INDICATOR SET OFF

## Enabling messages

---

This command enables writing messages to the console.

**Syntax**      `MODIFY xosf-jobname,ENABLE,nnnn[,...nnnn],t[,...t]`  
where

each *nnnn* is a message number, and each *t* is a message type. Enabling by message number writes that particular message. Enabling by message type writes all messages coded with that message type. You can specify one or more numbers and message types in a single command, and include them in any order.

**Example**      `F XP59,ENA,3430,0001,E`

**Messages issued**      In response, this message is displayed at the console:

MSF8009I    MESSAGE ENABLEMENT PROCESSING COMPLETE

If the designated message has been coded as non-suppressible, the console displays the following message in response to both the enable and the suppress commands:

MSF8038W    MSF UNABLE TO SUPPRESS OR ENABLE NON-SUPPRESSIBLE MSG  
ID='3430'

## Suppressing messages

---

This command suppresses writing messages to the console.

**Syntax**     `MODIFY xosf-jobname,SUPPRESS,nnnn,nnnn,t,t`  
 where each *nnnn* is a message number, and each *t* is a message type. Suppression by message number suppresses that particular message. Suppression by message type prevents all messages coded with that message type from being written to the console. You can specify any number of message numbers and message types in a single command and include them in any order.

**Example**     `F XP59,SUP,3430,0001`

**Messages issued**     The console displays this message:

```
MSF8008I MESSAGE SUPPRESSION PROCESSING COMPLETE
```

If the designated message has been coded as non-suppressible, the console displays the following message in response to both the enable and the suppress commands:

```
MSF8038W MSF UNABLE TO SUPPRESS OR ENABLE
 NON-SUPPRESSIBLE MSG ID='6309'
```

where

*nnnn* is the number of the message.

**Related information**     Using the MSFSUPPMEM initialization parameter, you can specify the name of a member that contains the suppression text (message number/message type) used to suppress message numbers or message types at start-up time. For more information on the MSFSUPPMEM initialization parameter, refer to [Section Five: XPAF Parameter and Keyword Reference](#). You can enable these messages later using the ENABLE command.

## 49. XDS-exclusive operator commands

XDS supplies operator commands that work as operands of the z/OS MODIFY operator command. From the operator console, you can enter XDS-exclusive commands to perform many functions, including:

- Defining an optional subsystem command character
- Displaying XDS control blocks in use
- Interrupting a printer
- Restarting a printer
- Terminating XDS with XOSF

Each command is described in this chapter.

---

**NOTE:** The space shown between command words is required, unlike JES commands for which you can omit the space.

---

When you enter these commands, *nnnn* is the printer ID number.

### Defining an optional subsystem command character

You can define a command character to abbreviate commands for both the XDS subsystem and the XOSF functional subsystem associated with it. The command character replaces this portion of the MODIFY z/OS operator command:

```
MODIFY xds-name,
```

The command character is defined in the XDSSTART proc. If you do not define a command character, you must use the MODIFY z/OS command to communicate with XDS and XOSF.

### Restrictions

The subsystem command character you define for XDS:

- Must not be the command character defined for any other subsystem.
- Can be any valid EBCDIC displayable special character appearing on the operator console keyboard. To reduce the number of keystrokes required, give preference to those characters that do not require the shift key for entry.
- Can be used when entering all XOSF-exclusive and XDS-exclusive operator commands.

## Example

---

This example shows the unabbreviated version of the INTERRUPT command:

```
MODIFY XP82,INTERRUPT PRT1900
```

If, at setup, you defined the character “ $\phi$ ” as the command character for XDS, you could abbreviate the previous command as:

```
 ϕ INTERRUPT PRT1900
```

or

```
 ϕ I PRT1900
```

**NOTE:** When using the command character to enter a command, do not type a space, comma, or other character between the command character and the command.

---

## Displaying XDS control blocks in use

---

This command displays all major XDS control blocks in use.

**Syntax**      `MODIFY xds-name,DISPLAY XDS`

**Example**      `F XP82,DIS XDS`

**Messages issued**      The console displays messages similar to these:

```
XDS1098I SSCVT
XDS1099I 00CCF2A8 E2E2C3E3 00CCF280 E7D7F8F2 00000000 *SSCT..2.XP82....*
XDS1099I 00CCF2B8 00CE8130 00000021 00CCF140 00CBB018 *..A.....1.....*
XDS1099I 00CCF2C8 00000000 00000000 00000000 00000000 *.....*
XDS1098I SSVT ...
```

## Interrupting a printer

---

This command interrupts an XDS-controlled XOSF printer.

**Syntax**      `MODIFY xds-name,INTERUPT PRTnnnn`

**Example**      `F XP82,I PRT1900`

**Message issued**      The console displays a message similar to this:  
XSL720EI    JOB00100 RK5689 PRINTING ABORTED BY XPAF

**Related information**      After you enter this command, XOSF prints the current record and releases the printer. The print application running as an XDS batch job or started task, which also specifies the XDS-controlled printer, is terminated with an S001 abend.

## Restarting a printer

---

XDS supports forms set up as defined by the SETUP initialization or printer profile parameter. After you load the requested forms on the printer, enter this command to restart the printer. For more information on the SETUP parameters, refer to [Section Five: XPAF Parameter and Keyword Reference](#).

**Syntax**      `MODIFY xds-name,START PRTnnnn`

**Example**      `F XP82,S PRT1900`

In this example, PRT1900 is the printer name specified in the XDS setup message.

**Message issued**      When XDS encounters the forms setup, it issues this message:  
XDS1031A    SET UP PRT1900 WITH FRM1 FORMS FOR JOB 5612

## Terminating XDS with XOSF

---

Using this command, XDS terminates with XOSF.

**Syntax**      `MODIFY xds-name,SYS SHUTDOWN`  
or  
`STOP xds-name`

**Example**      `F XP82,SYS SHUTDOWN`

**Messages issued**      The console displays messages similar to these:  
XDI3501I    XOSF SHUTTING DOWN  
XDS1001I    SUBSYSTEM INACTIVE  
XDI3405I    XP82 XOSF ADDRESS SPACE ENDING

## 50. XV2S-exclusive operator commands

XV2S supplies operator commands that work as operands of the z/OS MODIFY operator command. From the operator console, you can enter XV2S-exclusive commands to perform many functions, including:

- 
- Displaying XV2S printers
- Modifying XV2S printer characteristics
- Stopping and Restarting a printer
- Terminating XV2S

Each command is described in this chapter.

**NOTE:** The space shown between command words is required, unlike JES commands for which you can omit the space.

When you enter these commands, *nnnn* is the printer ID number.

### Example

This example shows the unabbreviated version of the INTERRUPT command:

```
MODIFY XP82,DISPLAY XV2S02
```

### Listing XV2S Printers

This command is used to display the attributes of all XV2S printers, or a single printer.

**Syntax**     MODIFY *xv2s-name*,LIST

**Example**     F XV2S,LIST

**Messages issued**     The console displays messages similar to these:

```
F XV2S,LIST
+XV2S0000I - PRINTER XV2S01/ACB=AT01 (INACTIVE)
+XV2S0000I+CLASS=1 FORM= A WRITER=PRT4 DEST=LOCAL
OUTDES=XEROX
+XV2S0000I+RECFM=FBA LRECL=133
+XV2S0000I - PRINTER XWTS02/ACB=AT02 (INACTIVE)
+XV2S0000I+CLASS=1 FORM=STD1A WRITER=PRT4 DEST=
OUTDES=
+XV2S0000I+RECFM=FBA LRECL=133
```

## Dynamically modifying an XV2S printer

---

This command will modify the characteristics of an XV2S printer.

**Syntax**     `MODIFY xv2-name,MODIFY,printer-name,attribute=value`

**Example**     `F XV2S,MOD,XV2S01,DEST=RMT7`

**Message issued**     The console displays messages similar to these:

```
F XV2S,MODIFY,XV2S01,DEST=RMT7
+XV2S0000I - PRINTER XV2S01/ACB=AT01 (INACTIVE)
+XV2S0000I+CLASS=1 FORM= A WRITER=PRT4 DEST=RMT7
OUTDES=XEROX
+XV2S0000I+RECFM=FBA LRECL=133
```

**Related information**     After modifying the printer attributes, you must stop and restart the printer to pick up the change.

You can change the following attributes:

ACB  
DEST  
DOCHDR  
FORM  
LRECL  
OUTDES  
RECFM  
SYSOUT  
WRITER

## Starting a printer

---

To start an XV2S printer, issue the start command

**Syntax**     `MODIFY xds-name,STAR PRTnnnn`

**Example**     `F XV2S,START PRT1900`

**Message issued**     The console displays messages similar to these:

```
F XV2S,START XV2S01
+XV2S0000I - PRINTER XV2S01 STARTED
```

## Stopping a printer

---

To stop an active XV2S printer, issue the stop command.

**Syntax**     `MODIFY xds-name,STOP PRTnnnn`

**Example**     `F XV2S,START PRT1900`

**Message issued**     The console displays messages similar to these:

```
F XV2S,STOP XV2S01
+XV2S0000I - PRINTER XV2S01 STOPPED
```

## Terminating XV2S

---

Using this command, XV2S terminates.

**Syntax**     `P xds-name`

**Example**     `P XV2S`

**Messages issued**     The console displays messages similar to these:

```
P XV2S
+XV2S0000I - XV2S TERMINATING
+XV2S0000I - PRINTER XV2S01 TERMINATED
+XV2S0000I - PRINTER XWTS02 TERMINATED
+XV2S0005I - CLOSING LOG FILE = NFORB.XV2S.LOGA
XV2S .STARTING.XV2S (1).XV2SMAIN Ended Code= 0
IEF404I XV2S - ENDED - TIME=08.08.52
```

# *Section Eight: Xerox Page Format Editor User Guide*

This section explains how to use the Xerox page format editor.

Before you begin to use the page format editor, verify that XPAF has been installed and that the installation verification procedures (IVPs) can be run successfully.

As a user of the page format editor, you should be familiar with IBM z/OS data administration, including allocating, loading, and deallocating sequential and partitioned datasets.

## 51. Page format overview

This chapter provides an overview of page formats and their use, and instructions for using the page format editor to create and maintain page formats.

### *What is a page format?*

---

A page format is a set of parameters used to format line-mode data streams that are printed through XPAF. Page formats cannot be used for printing other types of data streams (such as DJDE, XES, or AFP).

A page format must contain these types of formatting instructions:

- Copy modification parameters (for example, copy count, duplexing mode, report stacking, tray selection, and shift) that are unique to a set of copies
- Page layout parameters (for example, orientation, margin, logical page dimensions, and number of lines printed per inch) that describe the logical page
- Line layout parameters (for example, number of lines, first line origin, and font and color selection) that describe how lines or groups of lines are positioned on the page

A page format may also contain these types of optional formatting instructions:

- Field layout parameters (for example, position on page, font and color selection, position of data in input data stream, and constant text to be printed) that describe how individual fields within a line are positioned on the page
- Conditional formatting parameters (for example, conditions to be tested, action to be applied, location of action) that control document formatting based on conditions encountered in the input data stream

## Concepts and terms

---

Before you use the page format editor, you should be familiar with these terms:

- Physical page — The sheet of paper or medium on which you are printing.
- Logical page — The area of the physical page within which data can be printed.

You also should be familiar with how the concepts of physical page origin, logical page origin, logical page dimensions, and line group operate within the Xerox page formatting environment.

### Physical page origin

---

The physical page origin is a reference point from which the logical page's position is determined.

### Logical page origin

---

The logical page origin is the starting position of the logical page on the physical page. The logical page origin is specified in the copy modification parameters. The logical page origin is defined by measurements across and down from the physical page origin.

Both the physical and logical page origins are affected by the page's orientation. For example, a landscape orientation rotates the physical and logical page origins 90 degrees clockwise.

Figure 51-1 shows the physical and logical page origins for a portrait page. Figure 51-2 illustrates how the physical and logical page origins are shifted for inverse portrait, landscape, and inverse landscape orientations.

Regardless of the orientation, the origin for positioning data within the logical page is always the top left corner. As figure 51-3 shows, all text positioning values (both line and field) are calculated from this point.

Figure 51-1. Physical and logical page origins (portrait)

Figure 51-2. Effect of orientation on physical and logical page origins

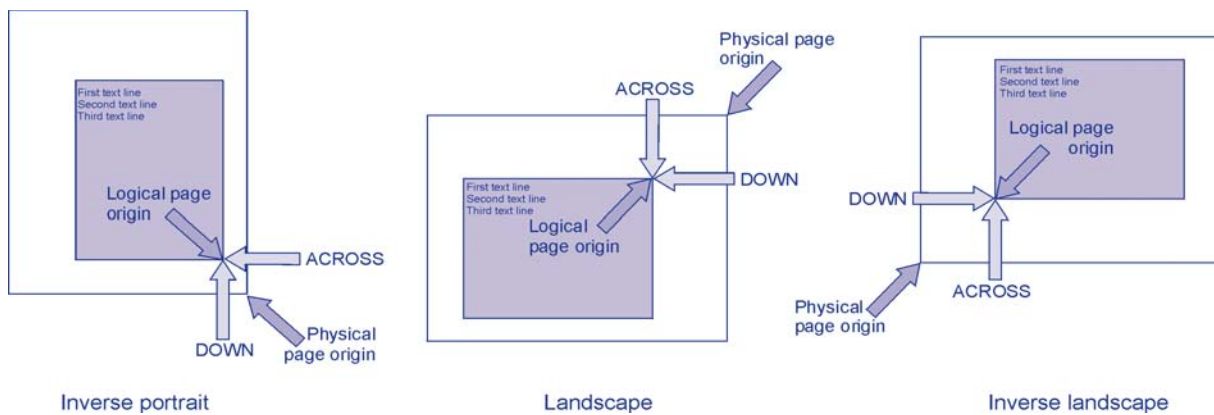

Figure 51-3. Text origins (portrait and landscape)

The final positioning of data on the physical page is determined by the page orientation and logical page origin and can be affected by other page formatting parameters. If you change the orientation of a page format, review these copy modification parameters to ensure that your printed document is formatted correctly:

- Page Origin Across
- Page Origin Down

In addition, review these page layout parameters:

- Width
- Height
- Count
- Line and field positions 'ACROSS' and 'DOWN'

The following examples illustrate how orientation affects text placement when all other parameters are unchanged.

Assume you want to format a telephone expense report that lists phone call charges by department and within department by extension. The report will be printed on 8.5 by 11 inch paper. Create a page format using these values in the page layout global specifications:

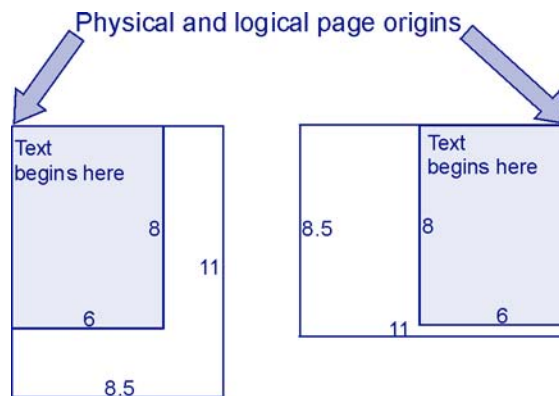

Width: 6  
Height: 8  
Margin: 0.5

and these values in the copy modification:

Page Origin Across: 0  
Page Origin Down: 0

Figure 51-4 shows the position of the first printed text line in both portrait and landscape orientations.

**Figure 51-4. Changing orientations without changing page format parameters**

To begin the first line of text 0.5 inch from the left side of the physical page shown in figure 51-5, make these changes to the page format for the landscape orientation:

Page Origin Across: 0  
Page Origin Down: 0  
Width: 11  
Height: 8  
Margin: 0.5

The parameters for the portrait orientation remain unchanged.

Figure 51-5. Changing page format parameters to match a change in orientation

## Logical page dimensions

The logical page dimensions are the dimensions of the logical page as defined by page width and height. Logical page dimensions are set in the page layout. The logical page cannot be larger than the physical page. When setting the logical page dimensions, you must consider the logical page origin as a factor.

For example, assume you are using a page whose physical dimensions are 8.5 by 11 inches, and the logical page origin is 0.5 across and 1.0 down. The maximum width available for the logical page is 8 inches (8.5 minus 0.5). The maximum height available is 10 inches (11 minus 1).

In this example, the unit of measure is inches; however, the page format editor also supports centimeters, millimeters, and dots.

You also can define a margin within the logical page and specify the number of lines to be printed per inch. In figure 51-6, the margin is shown on the left of the page; the line spacing is set at six lines per inch.

## Line group

---

A line group is a single line or a group of lines that are printed using the same formatting parameters. A logical page may contain:

- A single line group indicating all lines on the page are formatted using the same parameters
- Multiple line groups where each line group is formatted with different parameters

Figure 51-6 shows three line groups. For a line group, you can specify values for these parameters:

- Number of lines in the group.
- Origin of the line group. This is illustrated for line groups 1 and 3 in figure 51-7.
- Number of lines per inch.
- Channel skip code.
- Xerox font.
- Whether the lines are formatted as single lines or a series of fields. Line groups 1 and 3 in figure 51-7 illustrate line formatting, where each line in the group is represented by a solid line. Line group 2 in figure 51-7 illustrates field formatting, where each field is represented by the word FIELD and a number.
- Color.
- Whether conditional formatting is performed for this line group. Chapter 56, “[Using page layout options](#)” discusses conditional formatting.

You set up line groups in the page layout.

## Page format uses

---

A page format allows you to lay out a document according to your needs. This list identifies the key capabilities:

- Specify formatting instructions independently of the input data stream, allowing you to change from one page format to another without changing the data stream
- Format line-mode data streams into paginated documents
- Print one-up or multiple-up formats
- Merge variable data with electronic forms
- Highlight specific information using color
- Print constant data that is not contained in your input data stream
- Change formatting parameters based on predefined conditions that are encountered in your input data stream

Refer to chapter 60, “[Page format examples](#)” for practical illustrations of how these features can be applied.

Figure 51-6. Physical page, logical page, and line groups

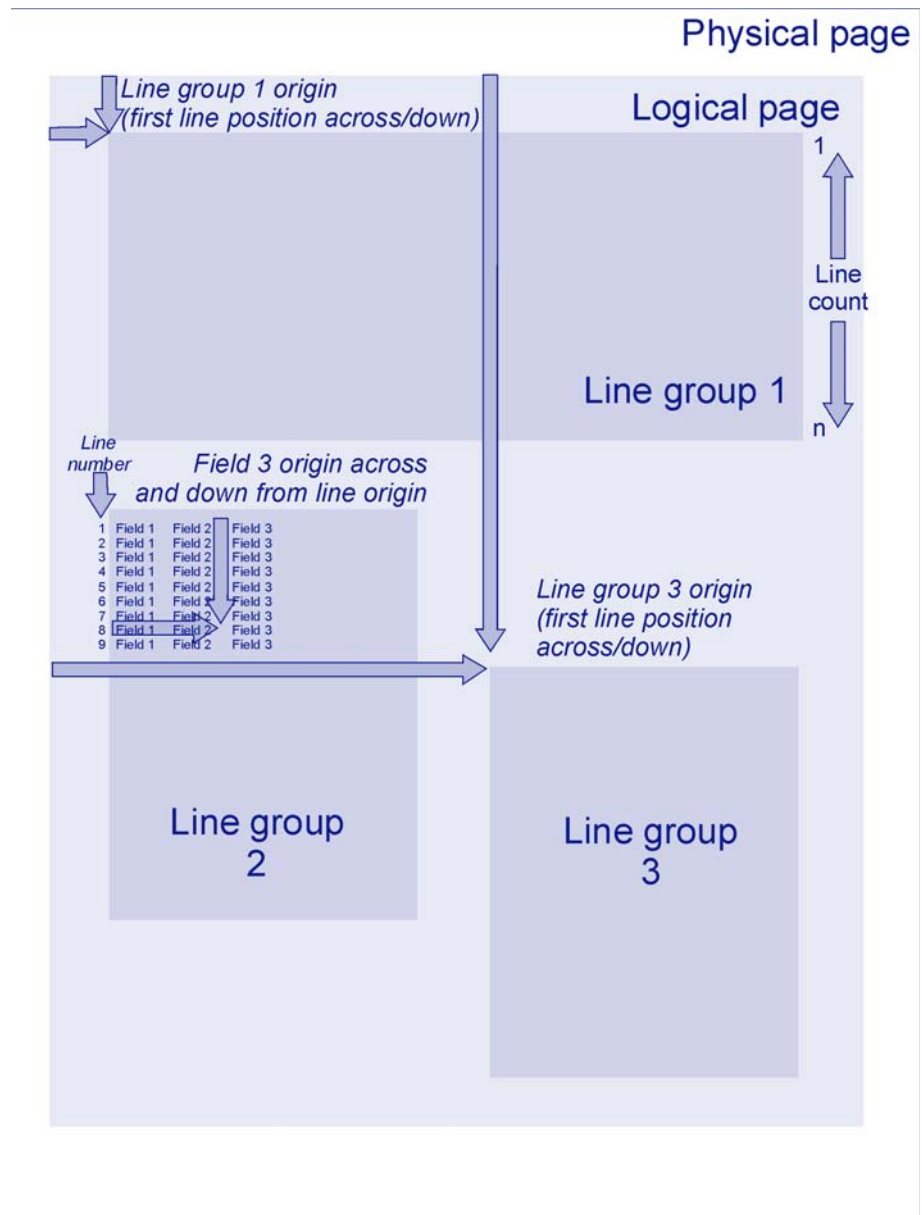

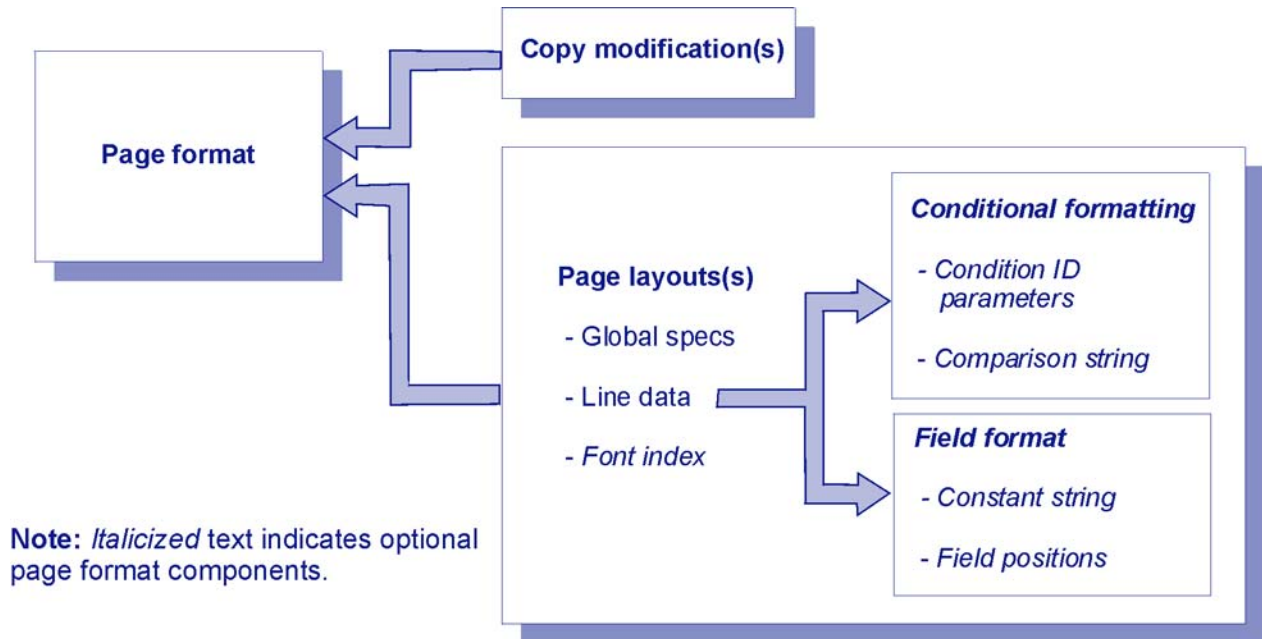

Figure 51-7. Line and field formatting

## Components of a page format

The major components of a page format are shown in figure 51-8. A page format consists of one or more copy modifications and one or more page layouts.

Figure 51-8. Page format components

## Copy modification

A copy modification consists of parameters that define how formatting changes from one set of copies to the next. You can establish any number of copy modifications within a page format, but each page format must have at least one copy modification defined.

By default, the first copy modification in your page format is used to format any data stream that calls the page format. To select a different copy modification, you must set up a conditional formatting statement. Refer to “[Conditional formatting](#)” later in this chapter for more information about conditional formats.

## Page layout

---

A page layout consists of parameters (such as orientation and dimensions) that define the logical page and how data is positioned on it. You can establish any number of page layouts within a page format, but each page format must have at least one page layout defined. By default, the first page layout in your page format is used to format any data stream that calls the page format.

To select a different page layout, you must set up a conditional formatting statement. Refer to “[Conditional formatting](#)” later in this chapter.

A page layout is composed of these elements:

- Global parameters, such as the logical page dimensions.
- Line group parameters, which define the positioning and appearance of lines of data on the printed page. Optionally, the line group may specify these types of formatting:
  - Conditional formatting, which permits changes in formatting based on conditions detected in the input data stream.
  - Field formatting, which allows you to format each line as a series of individual fields and apply different formatting to each field. Within a field format, you can specify whether the output field is associated with a constant string or information in the input data stream.
- A font list, which enables you to select Xerox fonts based on a font index entry in your input data stream. A font list is a list of fonts and their associated font index values. You can use font indexing in your input data stream as an alternative to specifying the font in the line group or field format. Only Xerox fonts can be used with the page format editor.

## Conditional formatting

---

Conditional formatting allows you to:

- Set up a condition (for example, 'greater than') to test against an input data stream
- Specify the copy modification and page layout to be used when the condition is met
- Specify where the change in formatting occurs

Each string in your input data stream that you want to test with conditional formatting requires a separate conditional formatting statement. You can test for a maximum of 25 conditions per line group.

Within a conditional formatting statement, you can test for multiple conditions on the same string, but only the first condition satisfied is acted upon. When a valid condition is encountered, all subsequent conditions within the active conditional formatting statement and all other conditional formatting statements are ignored.

The conditions can call for the same action or for a different action to be taken if the condition is true. When a condition is found to be true, XPAF changes the document formatting according to the action you have defined in the conditional formatting statement. The action affects the copy modification and/or page layout that you are using to format the data stream.

You control the location at which the action described by the conditional formatting statement occurs. The change to the copy modification or page layout used can occur at one of these locations:

- Before processing the current line or current line group
- After processing the current line or current line group

### *'Before' action processing*

---

If you are using 'before current line' or 'before current line group' processing which selects a different copy modification and/or page layout, the system processes the data associated with the current line or line group twice. The data is processed the first time using the current copy modification and page layout, then reprocessed using the copy modification and page layout specified by the conditional formatting statement. The data is not printed twice; only the formatting of the data changes.

Because you can set up multiple conditions for a line group, there is the potential for an infinite processing loop if multiple conditions specify the action to occur before a line or line group. However, page format processing has been designed to prevent looping. After a condition is met, XPAF processes the current line or line group; any subsequent conditions for this line or line group are ignored.

### *'After' action processing*

---

If you are using 'after current line' or 'after current line group' processing which selects a different copy modification and/or page layout, the new parameters do not take effect until the current line or line group has been processed.

## Field format

---

A field format is a set of formatting parameters specific to individual fields on a line. Field formatting is suited to laying out tables and merging variable data with electronic forms.

You can specify values for these field format parameters:

- The location of the field in the line in the input data stream
- The position and print direction of the field on the line in the printed output
- Xerox font
- Color

You also can specify whether the data for this field is taken from the input data stream or a constant string. A constant string allows you to print text that is not contained in the input data stream in your document; that is, the data you print is independent of your input data stream.

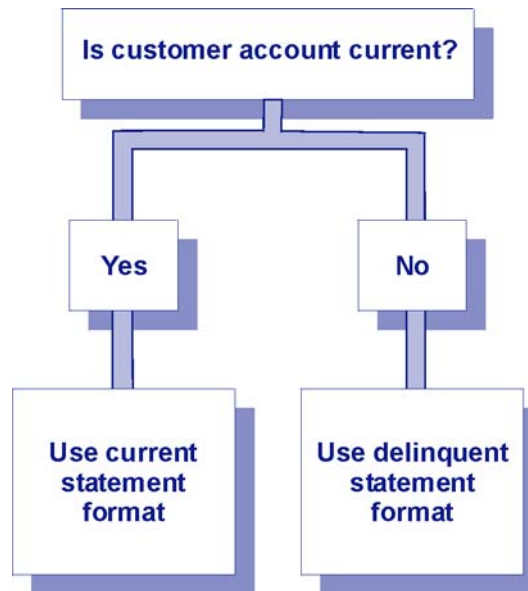

A constant string also may be the only thing printed on the line. If the constant string is the only element to be printed, the corresponding line in your input data stream must be blank.

A constant string is processed only if there is a corresponding line in the input data stream, and only if that line is processed. For example, a constant string is not printed if a channel skip results in the line not being processed.

## Example

Assume you are printing monthly billing statements for your customers. As shown in figure 51-9, customers whose accounts are current receive statements in one format, while customers whose accounts are delinquent receive statements in a different format. Each statement format is defined by a separate form.

Figure 51-9. Customer statement processing flow

Assume your application generates an input data stream to XPAF that contains data for both current and delinquent accounts. The following illustration is a sample of what the input data stream might look like for the customer statement example. Columns 2 through 32 contain the customer's name. Column 80 contains a code indicating the account status: C indicates the account is current and D indicates the account is delinquent.

| 1               | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|-----------------|---|---|---|---|---|---|---|---|
| CUSTOMER 1 NAME |   |   |   |   |   |   | C |   |
| .               |   |   |   |   |   |   |   |   |
| .               |   |   |   |   |   |   |   |   |
| CUSTOMER 2 NAME |   |   |   |   |   |   | D |   |
| .               |   |   |   |   |   |   |   |   |
| .               |   |   |   |   |   |   |   |   |
| CUSTOMER 3 NAME |   |   |   |   |   |   | C |   |
| .               |   |   |   |   |   |   |   |   |
| .               |   |   |   |   |   |   |   |   |
| CUSTOMER 4 NAME |   |   |   |   |   |   | C |   |

Using conditional formatting, you could merge the data with the appropriate statement format without any preprocessing of your application output. In the example, the condition is the account status: current or delinquent.

The example illustrates an 'equal to' condition. There are two 'equal to' conditions in the same statement, each of which specifies a different action.

Each string in your input data stream that you want to test with conditional formatting would require a separate conditional formatting statement. For example, you could set condition statement 1 to test for the account status code and condition statement 2 to test for a change in the customer name.

The change in formatting is a call for the appropriate customer statement. The change occurs before the current record is processed so that the customer information will be printed on the correct statement.

The action in the example is to use a named copy modification. Use the same page layout, but begin printing on a new physical sheet. The named copy modification contains the appropriate statement format.

Within a condition ID in the page format, you would set up these conditional formatting statements:

- To test for a current account and select a copy modification named STMTTC, which contains the statement format for current accounts, use these values:
  - Start position: 80
  - Length: 1
  - Comparison text: C
  - Type: EQ (Is the input value equal to C?)
  - Copy modification name: STMTTC
  - Page layout name: NULL
- To test for a delinquent account and select a copy modification named STMTD, which contains the statement format for delinquent accounts, use these values:
  - Start position: 80
  - Length: 1
  - Comparison text: D
  - Type: EQ (Is the input value equal to D?)
  - Copy modification name: STMTD
  - Page layout name: NULL

Alternatively, you could use the EQ and OT type codes to the select customer statement formats. By specifying OT as Type and leaving the Comparison text field blank in the STMD copy modification, the input field would be tested only once.

Refer to chapter 60, "[Page format examples](#)" for additional examples using step-by-step procedures.

## Creating and generating a page format

---

Use the page format editor (XOAF option P) to:

- Create the page format using the ISPF panels. The information you enter through the ISPF panels is stored in an editable format in libraries that you allocate during installation or by using the Allocate Page Format Datasets option.
- Generate the page format. This process transforms the source you create using the ISPF panels into machine-readable format. The generated page format is the version that you reference using the PAGEFORM extended JCL keyword when printing a document.

Generated page formats are stored in your XPAF page format library. This is the library referenced by the PGFRMDD initialization parameter or PAGEFORMLIB printer profile parameter.

Your page format library must have these file specifications:

```
DSORG: PO
RECFM: VB
LRECL: 8205
BLKSIZE: 8209
```

If you change a page format through XOAF after you generate it, you must regenerate it for the changes to take effect.

Procedures for each task are provided in Section Eight.

## Invoking a page format

---

Use the PAGEFORM extended JCL keyword to invoke a page format when you submit a job. For detailed information about printing page-formatted documents, refer to [Section Four: Printing Documents with XPAF](#). Refer to [Section Five: XPAF Parameter and Keyword Reference](#) for information about the PAGEFORM extended JCL keyword.

## 52. Introduction to the page format editor

This chapter describes how to access and use the Xerox page format editor through the Xerox Output Administrative Facility (XOAF). You use the page format editor to create and update page formats used to format line-mode data streams.

This chapter also discusses the conventions used for the ISPF panels that can be accessed through the Xerox page format editor.

### Panel conventions

---

You should be aware of the following conventions when using the ISPF panels in the Xerox page format editor.

### Panel keys

---

These keys are in effect when you use the panels:

- Press the **ENTER** key to cause XPAF to process your input.
- Enter either the **HELP** command on the COMMAND line or press the **PF1** function key to display online information about how to use that panel.
- Enter either the **END** command on the COMMAND line or press the **PF3** function key to return to a previous panel.

In addition, you must use the 'D' option on a selection panel to delete an individual element from a list of elements. You cannot delete the element by using the ErEOF key or space bar to erase the name.

---

**NOTE:** If you have remapped your standard PF keys, use the appropriate keys to perform these functions.

---

## Valid values

---

Where space permits, the valid values or range of values for a field appear after the field name. For example, this partial panel shows that the only valid values for the 'Report Stacking' and 'Split Report' fields are YES and NO.

---

---

```

Form Name for Front:
Form Name for Back:
 BFORM Name:
Report Stacking (YES/NO): NO
Split Report (YES/NO): NO

```

---

---

Information about the valid values for fields on a panel also appears in the Help panel for that function.

Dataset names can be 1- to 44-characters long. Unless otherwise noted, dataset names and member names must follow standard z/OS naming conventions.

## Panel message display

---

ISPF messages may appear when you use the Xerox page format editor panels. The ISPF messages for the page format editor use the prefix XOAF or XPFE and are documented in [Section Six: XPAF Messages](#).

XPAF writes two versions of each ISPF message to the TSO terminal:

- A short version that appears on the first row of an XOAF panel.
- A long version that appears on the third row of an XOAF panel. You can display this message only by either entering HELP on the COMMAND line and pressing ENTER, or by pressing the PF1 key.

---

**NOTE:** If you are using the ISPF window “pop-up” option for messages, the long version of the ISPF message can be displayed anywhere on the panel.

If the long version of a message overwrites the OPTION or COMMAND line, press **ENTER** to refresh the panel display.

---

Other ISPF messages may be issued from the host system. These messages are issued without a message number and prefix, and include both uppercase and lowercase characters. Because these messages are not issued by XPAF, they are not documented in *Xerox Printer Access Facility Version 5.0 Messages*.

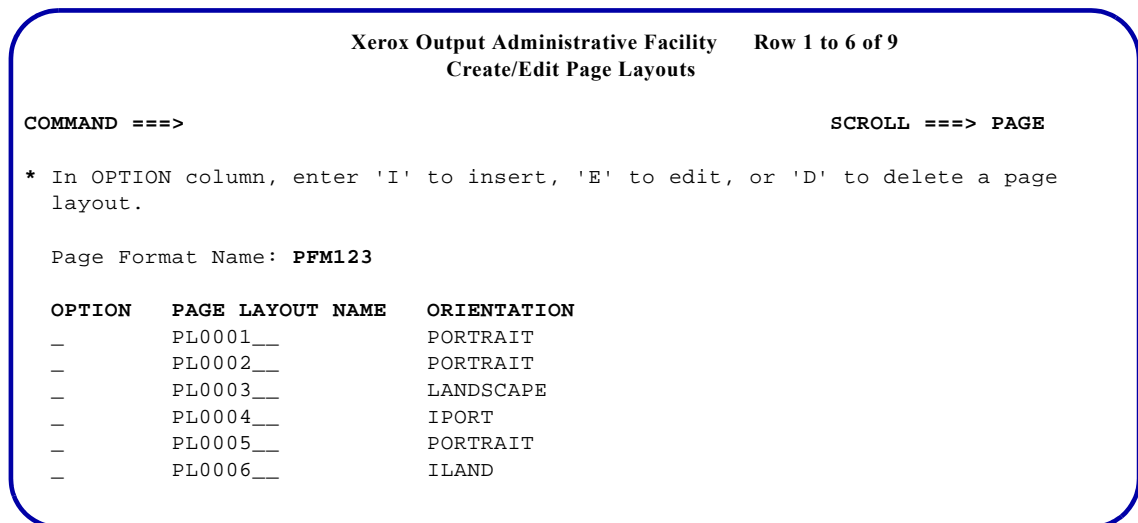

This sample panel shows both versions of an ISPF message issues by XPAF:

## Scroll fields

A 'SCROLL' field appears on some panels where the number of rows of data to be displayed exceeds the physical rows available on the terminal page. The 'SCROLL' field enables you to page forward and backward through the list of data using the page FORWARD and BACKWARD commands or function keys (typically PF8 and PF7).

For example, this panel shows a 'SCROLL' field:

Panels containing a 'SCROLL' field display a message in the upper right corner indicating which rows currently are being viewed and the total number of rows available for viewing.

## *COPY command*

---

If you are creating or editing a page format component that is similar to an existing component, you can use the COPY command to copy the parameters from the existing component. For example, you can copy the parameters from an existing copy modification to use as the basis for a new copy modification that you are creating.

The COPY command is available when you perform any of these functions:

- Specifying copy modification parameters
- Specifying global parameters
- Specifying line data parameters
- Specifying a field format
- Specifying conditional formatting parameters
- Editing a font list

To use this command, perform one of these steps:

- Enter **COPY** on the COMMAND line followed by a space, then the name of the existing component. Press **ENTER**.
- Enter **COPY** on the COMMAND line, then press **ENTER**. The system displays a selection list of existing members for that component type. To select a member from the list, enter **S** next to the appropriate name, then press **ENTER**.

The system copies the parameters from the component and updates the fields on the panel with the new values. For global specifications, line data specifications, and font lists, the system also copies all page layout data, including conditional formatting parameters, field formats, and the font list.

## System Services menu

---

**CAUTION:** When you log on to TSO, you must use a minimum region size of 4M to run the page format editor.

---

When you invoke XOAF, this menu appears:

**Xerox Output Administrative Facility**  
**System Services 5.0**

OPTION ===>

- 1. Load Resources
- 2. Convert Resources
- 3. Manage Resource Lists
- 4. Manage Tables
- 5. Manage Custom Replica Fonts
- 6. Refresh PDS / Display Printer Status
- 7. Manage Libraries
  
- E. ISPF Edit
- I. Installation Verification Procedure
- P. Xerox Page Format Editor
- T. Help Tutorial
- X. Exit

From this menu, select option **P** and press **ENTER** to access the Xerox page format editor.

**NOTE:** Section Eight focuses on the functions provided through option P on the System Services menu. For information about the other System Services menu options, refer to *Section Three: Managing Resources with XPAF*.

---

## Xerox Page Format Editor menu

---

After you enter P at the System Services menu OPTION line, this menu appears:

Xerox Output Administrative Facility  
Xerox Page Format Editor

OPTION ==>

1. Allocate Page Format Datasets
2. Maintain Page Formats
3. Copy Page Format Source Members
4. Update Xerox Font Characteristics Information

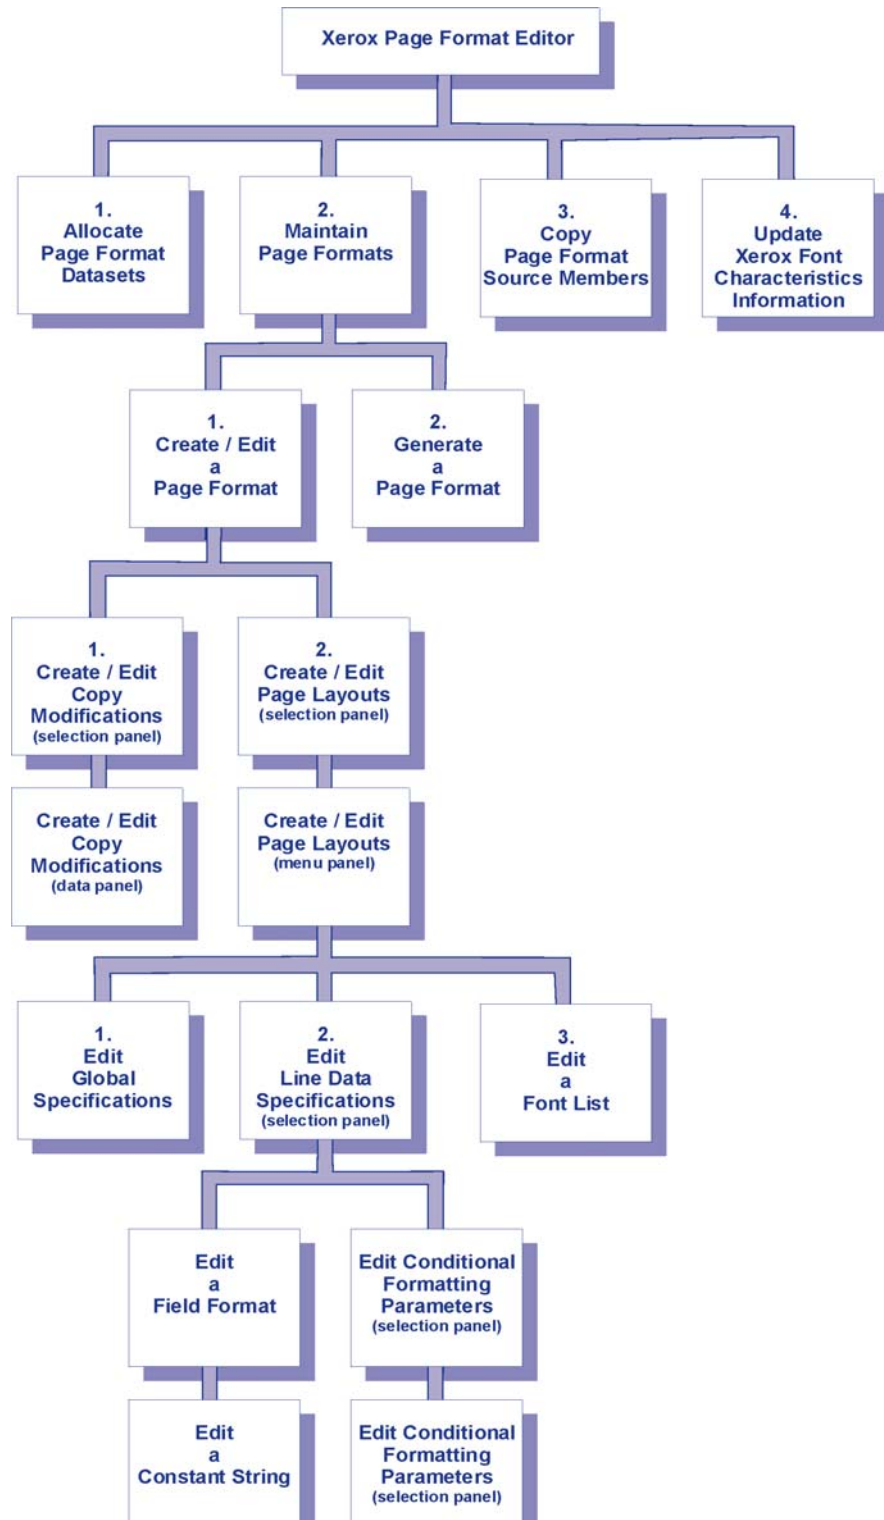

Select the option you want to perform and press **ENTER**:

- Enter **1** if you are accessing the page format editor for the first time or you want to change your source dataset prefix for a session. Refer to Chapter 53, "[Allocating page format datasets](#)," for more information.
- Enter **2** to create, edit, or generate page formats. Refer to [chapter 54](#), [chapter 55](#), [chapter 56](#), and [chapter 57](#) for more information.
- Enter **3** to copy a page format's source members from one set of datasets to another. Refer to chapter 58, "[Copying page format source members](#)," for more information.
- Enter **4** to update Xerox font characteristics information. Refer to chapter 59, "[Updating Xerox font characteristics information](#)," for more information.

Figure 52-1 shows the organizational flow of the menus/options accessible through this panel.

Figure 52-1. Organizational flow of page format editor panels

## 53. *Allocating page format datasets*

This chapter provides instructions about how to set up and maintain your configuration. The first time you access the page format editor after you install XPAF, you must define a dataset name high-level qualifier and dataset allocation values for the libraries shown in table 53-1 where page format component source members are stored.

Table 53-1. Page format libraries

| Library name  | Function                                                                       |
|---------------|--------------------------------------------------------------------------------|
| <b>COND</b>   | Stores conditional formatting data specifications.                             |
| <b>CPMOD</b>  | Stores copy modification data specifications.                                  |
| <b>FIELDD</b> | Stores field data specifications.                                              |
| <b>FLIST</b>  | Stores a member that contains a list of copy modifications in the page format. |
| <b>LINED</b>  | Stores page layout data specifications.                                        |
| <b>PLIST</b>  | Stores a member that contains the list of page layouts in the page format.     |

You can change the high-level qualifier prefix and allocate a different set of datasets at any time.

## Setting up your configuration

To set up your configuration for the first time, enter **1** at the Xerox Page Format Editor menu OPTION line and press **ENTER**. A panel similar to this appears:

**Xerox Output Administrative Facility**  
**Allocate Page Format Datasets**

COMMAND ===>

Dataset Prefix:

DATASET OPTIONS

Allocation Units (CYLS/TRKS/BLKS): TRKS

Volume (blank for default):

| SPECIFICATIONS       | COND | CPMOD | FIELD | FLIST | LINED | PLIST |
|----------------------|------|-------|-------|-------|-------|-------|
| Primary Allocation   | 3    | 3     | 3     | 3     | 3     | 3     |
| Secondary Allocation | 1    | 1     | 1     | 1     | 1     | 1     |
| Directory Blocks     | 20   | 10    | 20    | 10    | 10    | 10    |
| Record Length        | 8204 | 255   | 160   | 40    | 8204  | 40    |
| Record Format        | VB   | FB    | FB    | FB    | VB    | FB    |
| Block Size           | 8208 | 7650  | 8800  | 8800  | 8208  | 8800  |

Complete these fields:

| Field/Column          | Action                                                                                                                                                                                                                                                  |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dataset Prefix</b> | <p>Enter the fully-qualified prefix to be attached to these page format source datasets:</p> <p>COND<br/>CPMOD<br/>FIELD<br/>FLIST<br/>LINED<br/>PLIST</p> <p>Do not enclose the prefix in quotes; XOAF does not attach your user ID to the prefix.</p> |

| Field/Column                                       | Action                                                                                                                                                                                                                                                             |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DATASET OPTIONS</b><br><b>Allocation Units</b>  | Enter the dataset allocation units.<br>Valid values:<br>CYLS    Cylinders<br>TRKS    Tracks<br>BLKS    Blocks<br><br>Default: TRKS                                                                                                                                 |
| <b>Volume</b>                                      | Enter the volume serial number of the DASD on which you want to allocate the datasets or leave this field blank to use your TSO default volume.                                                                                                                    |
| <b>SPECIFICATIONS</b><br><b>Primary Allocation</b> | Enter the number of units of primary allocation for the datasets.<br>Default: 3                                                                                                                                                                                    |
| <b>Secondary Allocation</b>                        | Enter the number of units of secondary allocation for the datasets.<br>Default: 1                                                                                                                                                                                  |
| <b>Directory Blocks</b>                            | Enter the number of directory blocks to be allocated for the datasets. When setting this value, consider that there will be a large number of small members in these datasets.<br>Default:<br>For CPMOD, FLIST, LINED, and PLIST: 10<br>For COND and FIELD DD: 20  |
| <b>Record Length</b>                               | This field displays the record length. You cannot change this value.                                                                                                                                                                                               |
| <b>Record Format</b>                               | This field displays the record format. You cannot change this value.                                                                                                                                                                                               |
| <b>Block Size</b>                                  | Enter the number of records per block on your DASD device. The block size is based on the record length and record format.<br>Defaults:<br>COND        8208<br>CPMOD       7650<br>FIELD DD    8800<br>FLIST        8800<br>LINED        8208<br>PLIST        8800 |

After you complete your entries, press **ENTER** to allocate the datasets to be used during this session. The system displays the Maintain Page Formats panel.

Xerox Output Administrative Facility    PREFIX XE9999

Maintain Page Formats

OPTION ===>

1.    Create/Edit a Page Format

2.    Generate a Page Format

Page Format Name:

Page Format Library Name: 'prefix.PAGEFORM'

| Editor Dataset Allocation Status |           |
|----------------------------------|-----------|
| prefix.COND                      | Allocated |
| prefix.CPMOD                     | Allocated |
| prefix.FIELD                     | Allocated |
| prefix.FLIST                     | Acquired  |
| prefix.LINED                     | Acquired  |
| prefix.PLIST                     | Acquired  |

If the allocation status for a dataset shows Allocated, your dataset allocation was successful. If the allocation status for a dataset shows Acquired, the dataset existed already and has been acquired for use.

Refer to chapter 54, “[Selecting a page format](#),” for more information about this panel.

## Maintaining your configuration

---

You may at some future date need to change your configuration options. For example, if your data processing organization changes naming conventions, you may need to change the dataset name prefix. You also may find that the allocation for a particular dataset needs to be expanded.

### Changing your dataset name prefix

---

To change your dataset name prefix, follow this procedure:

- Step 1.** Access the Allocate Page Format Datasets panel using the procedure described previously. This panel displays your current dataset name high-level qualifier and the default allocation values.
- Step 2.** Type over the current dataset name prefix with the new high-level qualifier, then press **ENTER**. The system allocates new datasets, then displays the Maintain Page Formats panel.
- Step 3.** Use the ISPF copy utility to copy your page format source members from the old datasets to the new datasets.
- Step 4.** After you verify your page format source members have been copied successfully to the new datasets, delete the old datasets.

### Expanding your dataset space allocation

---

To change your dataset space allocation, follow this procedure:

- Step 1.** Rename your existing page format source dataset(s).
- Step 2.** Access the Allocate Page Format Datasets panel using the procedure described previously. This panel displays your current dataset name high-level qualifier and the default allocation values.
- Step 3.** Type over the existing specifications with your new values, then press **ENTER**. The system allocates new datasets, then displays the System Services menu.
- Step 4.** Use the ISPF copy utility to copy your page format source members from the renamed dataset(s) to your expanded dataset(s).
- Step 5.** After you verify your page format source members have been successfully copied to the expanded dataset(s), delete your renamed dataset(s).

## 54. Selecting a page format

This chapter describes how to navigate through the page format editor panels to create a new page format or edit an existing format.

**NOTE:** When you first create a page format, it contains default values. The default page format values supplied with XPAF are contained in the DEFAULT page format. If the default values do not meet your needs, you can change them by editing this page format. For example, you can change the default units of measurement for page height and width from inches to centimeters.

### Specifying a page format

To create or edit a page format, follow this procedure.

- Step 1.** Enter **2** at the Xerox Page Format Editor menu **OPTION** line and press **ENTER**. This panel appears:

Xerox Output Administrative Facility   PREFIX XE99999  
Maintain Page Formats

OPTION ===>

1.   Create/Edit a Page Format
2.   Generate a Page Format

Page Format Name:

Page Format Library Name:

The prefix of the datasets allocated for this page format editor session appears in the top right corner of the panel. To allocate different datasets for this session, invoke option 1, Allocate Page Format Datasets, from the Xerox Page Format Editor menu and enter a different prefix in the 'Dataset Prefix' field.

- Step 2.** Enter **1** at the Maintain Page Formats menu **OPTION** line. If you are creating a new page format, or you know the name of an existing page format you want to edit, enter the name in the 'Page Format Name' field, leave the 'Page Format Library Name' field blank, and press **ENTER**. Skip steps 3 and 4 and continue with step 5. If you are editing an existing page format, but you do not know the exact name, continue with step 3.

- Step 3.** Leave the 'Page Format Name' field blank or enter the first few characters of the name followed by an asterisk ( \* ), then press **ENTER**. A panel similar to this one appears and displays a list of the existing page formats that match the name pattern you entered or all page formats if you left the field blank.

```

MEMBER LIST ----- ROW 00001 OF 00002
COMMAND ==> SCROLL ==> PAGE
 Name VV.MM Created Changed Size Init Mod ID
 DFLT1
 FMTA
 FMTB
 FMTC
 FMTD
 L0002
 L0003
 L0004
 END

```

- Step 4.** To select a page format from this list, tab to the field next to the character set name, enter **S**, and press **ENTER**.

This menu appears:

```

 Xerox Output Administrative Facility
 Create/Edit a Page Format

OPTION ==>

 1. Create/Edit Copy Modifications

 2. Create/Edit Page Layouts

```

Select the option you want to perform and press **ENTER**:

- Enter **1** to create or edit the copy modifications for this page format. Proceed to chapter 55, "[Using copy modification options.](#)"
- Enter **2** to create or edit the page layouts for this page format. Proceed to chapter 56, "[Using page layout options.](#)"

## 55. Using copy modification options

This chapter describes how to maintain the copy modifications contained in a page format.

**NOTE:** If you are using conditional formatting to select different copy modifications, you must add the copy modifications named in the condition ID to the copy modification list and define their parameters. The names must be identical in both places or an error will occur when you generate the page format.

### Selecting a copy modification

Enter **1** at the Create/Edit a Page Format menu OPTION line and press **ENTER**. A panel similar to this appears:

```

Xerox Output Administrative Facility Row 1 to 3 of 3
Create/Edit Copy Modifications

COMMAND ==> SCROLL ==> PAGE

* In OPTION column, enter 'I' to insert, 'E' to edit, or 'D' to delete a copy
 modification.

Page Format Name: PFM123

OPTION COPY MODIFICATION NAME
_ CPM001__
_ CPM002__
_ CPM003__
***** BOTTOM OF DATA *****

```

Complete these fields and press **ENTER**:

| Field/Column                  | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Page Format Name</b>       | This field displays the name of the page format you are creating or editing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>OPTION</b>                 | <p>Enter the letter that corresponds to the function you want to perform.</p> <p>Valid values:</p> <ul style="list-style-type: none"> <li>I Inserts a line below this line. You must type a unique copy modification name for the system to add it to the page format. The system erases any blank lines when you update the record.</li> <li>E Creates or edits parameters for the identified copy modification. Refer to “<a href="#">Specifying copy modification parameters</a>” later in this chapter.</li> <li>D Deletes the identified copy modification name from the page format. You cannot delete all copy modifications from the page format; you must leave at least one copy modification. The copy modification member of the same name is not deleted from the CPMOD source library.</li> </ul> |
| <b>COPY MODIFICATION NAME</b> | <ul style="list-style-type: none"> <li>• If you are creating a new page format, this panel displays a single copy modification named DEFAULT. This is the default copy modification that is provided with XPAF. Type over this name with the 1- to 8-character name of the copy modification you are creating. This must be a unique name that begins with an alphabetic character, @, #, or \$. The new copy modification is initialized with the values contained in DEFAULT.</li> <li>• If you are editing a page format, this panel displays the existing copy modifications in the order in which you entered them.</li> <li>• If you are inserting or repeating a line, enter the new copy modification name, typing over the existing name if necessary.</li> </ul> <p>Default: DEFAULT</p>              |

## Specifying copy modification parameters

After you enter E in the 'OPTION' column of the Create/Edit Copy Modifications panel, a panel similar to this appears:

**Xerox Output Administrative Facility**  
**Create/Edit Copy Modifications**

COMMAND ==>

```

Copy Modification Name: CPM001
Unit Measure (CM/DOT/IN/MM): IN
 Page Origin Across: 0
 Page Origin Down: 0.5
Number of Copies (1 to 255): 1

|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Signal Function 1</b> | <p>Specify whether XPAF sends a DJDE to a centralized printer to raise or lower signal function 1 at the start of a page that uses this copy modification. Signal function 1 is used by printers running the Document Finishing Architecture (DFA) interface (version 4.1 or higher) to communicate with finishing equipment provided by third-party vendors. XPAF does not determine the function of signal function 1; the function is defined by the document finishing equipment supplied by the third-party vendor.</p> <p>Valid values:</p> <p>YES      Sends the SF1=YES DJDE to the printer to raise (that is, turn on) signal function 1 for output using this copy modification. XPAF will send the SF1=YES DJDE only if the FEATURE parameter specifies a value of DFA in the printer's profile. Refer to <a href="#">Section Five: XPAF Parameter and Keyword Reference</a> for information about the FEATURE printer profile parameter.</p> <p>NO        Sends the SF1=NO DJDE to the printer to lower (that is, turn off) signal function 1 for output using this copy modification.</p> <p> <b>NOTE:</b> Refer to the finishing equipment documentation supplied by your third-party vendor for information about the equipment's use of signal functions. For information about DJDEs, refer to the PDL/DJDE reference manual for your printer.</p> |

| Field                       | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Signal Function 2</b>    | <p>Specify whether XPAF sends a DJDE to a centralized printer to raise or lower signal function 2 at the start of a page that uses this copy modification. Signal function 2 is used by printers running the Document Finishing Architecture (DFA) interface (version 4.1 or higher) to communicate with finishing equipment provided by third-party vendors. XPAF does not determine the function of signal function 2; the function is defined by the document finishing equipment supplied by the third-party vendor.</p> <p>Valid values:</p> <p>YES      Sends the SF2=YES DJDE to the printer to raise (that is, turn on) signal function 2 for output using this copy modification. XPAF will send the SF2=YES DJDE only if the FEATURE parameter specifies a value of DFA in the printer's profile. Refer to <a href="#">Section Five: XPAF Parameter and Keyword Reference</a> for information about the FEATURE printer profile parameter.</p> <p>NO        Sends the SF2=NO DJDE to the printer to lower (that is, turn off) signal function 2 for output using this copy modification.</p> <p> <b>NOTE:</b> Refer to the finishing equipment documentation supplied by your third-party vendor for information about the equipment's use of signal functions. For information about DJDEs, refer to the PDL/DJDE reference manual for your printer.</p> |
| <b>Separator Page First</b> | <p>Specify whether XPAF sends a SEPARATORS=FIRST DJDE to indicate that a separator should be printed for every segment of the corresponding copy group. This option will take effect only for centralized printers that have a value of DFA specified for the FEATURE parameter in the printer's profile. Refer to <a href="#">Section Five: XPAF Parameter and Keyword Reference</a> for more information about the FEATURE printer profile parameter.</p> <p>Valid values:</p> <p>YES      Sends the SEPARATORS=FIRST DJDE to the printer to insert a separator as the first page of each printed output segment using this copy modification.</p> <p>NO        Does not send the SEPARATORS=FIRST DJDE to the printer for this copy modification.</p> <p>Default: NO</p> <p> <b>NOTE:</b> For information about DJDEs, refer to the PDL/DJDE reference manual for your printer.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Figure 55-1. Effect of orientation on page origin

## 56. *Using page layout options*

This chapter describes how to maintain the list of page layouts that are contained in a page format.

**NOTE:** If you are using conditional formatting to select a different page layout, you must add the page layouts named in the condition ID to the page layout list and define their parameters. The names must be identical in both places or an error will occur when you generate the page format.

## Selecting a page layout

Enter **2** at the Create/Edit a Page Format menu **OPTION** line and press **ENTER**. A panel similar to this appears:

```

Xerox Output Administrative Facility Row 1 to 2 of 2
Create/Edit Page Layouts

COMMAND ==> SCROLL ==> PAGE

* In OPTION column, enter 'I' to insert, 'E' to edit, or 'D' to delete a page
 layout.

Page Format Name: PFM123

OPTION PAGE LAYOUT NAME ORIENTATION
- PL0001__ PORTRAIT
- PL0002__ PORTRAIT

```

Complete these fields and press **ENTER**:

| Field/Column            | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Page Format Name</b> | This field displays the name of the page format you are creating or editing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>OPTION</b>           | <p>Enter the letter that corresponds to the function you want to perform.</p> <p>Valid values:</p> <ul style="list-style-type: none"> <li>I Insert a line below this line. To add the entry to the page format, type a unique page layout name for the system.</li> <li>E Creates or edits parameters for the identified page layout. Refer to <a href="#">“Selecting page layout parameters”</a> later in this chapter for details.</li> <li>D Deletes the identified page layout from the page format. You cannot delete all page layouts from the page format; you must leave at least one page layout. The page layout member of the same name is not deleted from the LINED source library.</li> </ul>                                                        |
| <b>PAGE LAYOUT NAME</b> | <ul style="list-style-type: none"> <li>• If you are creating a new page format, this panel displays a single page layout named DEFAULT. This is the default page layout that is provided with XPAF. Type over this name with the 1- to 8-character name of the page layout you are creating. This must be a unique name that begins with an alphabetic character (A–Z), @, #, or \$. The new page layout is initialized with the default values contained in DEFAULT.</li> <li>• If you are editing a page format, this panel displays the existing page layouts in the order in which you entered them.</li> <li>• If you insert or repeat a line, enter the new page layout name, typing over the existing name if necessary.</li> </ul> <p>Default: DEFAULT</p> |

| Field/Column                                                                        | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                     |                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ORIENTATION</b>                                                                  | <p>Enter the page layout print direction. Remember that the interrelation of physical page parameters (such as page origin) and logical page parameters (such as orientation) determines the actual placement of text in a document. Figure 56-1 illustrates how the text is placed.</p> <p>Valid values:</p> <table> <tr> <td> <p>PORTRAIT, PORT, or P</p> <p>IPOINT</p> <p>LANDSCAPE, LAND, or L</p> <p>ILAND</p> </td><td> <p>The print direction is from left to right and lines are added from top to bottom.</p> <p>The print direction is from right to left and lines are added from bottom to top.</p> <p>The print direction is from left to right and lines are added from top to bottom.</p> <p>The print direction is from right to left and lines are added from bottom to top.</p> </td></tr> </table> <p>Default: PORTRAIT</p> | <p>PORTRAIT, PORT, or P</p> <p>IPOINT</p> <p>LANDSCAPE, LAND, or L</p> <p>ILAND</p> | <p>The print direction is from left to right and lines are added from top to bottom.</p> <p>The print direction is from right to left and lines are added from bottom to top.</p> <p>The print direction is from left to right and lines are added from top to bottom.</p> <p>The print direction is from right to left and lines are added from bottom to top.</p> |

Figure 56-1. Effect of orientation on print direction

## Selecting page layout parameters

---

After you enter E in the 'OPTION' column of the Create/Edit Page Layouts panel, a menu similar to this appears:

**Xerox Output Administrative Facility**  
**Create/Edit Page Layouts**

OPTION ==>

1. Edit Global Specifications
2. Edit Line Data Specifications
3. Edit a Font List

Select the option you want to perform and press **ENTER**:

- Enter **1** to edit specifications that apply to the entire page layout (for example, logical page size). Refer to [“Specifying global parameters”](#) later in this chapter.
- Enter **2** to edit specifications for individual lines, including conditional formatting parameters and field formats. Refer to [“Specifying line data parameters”](#) later in this chapter.
- Enter **3** to edit the Xerox font list for this page layout. Refer to [“Specifying font list parameters”](#) later in this chapter.

## Specifying global parameters

---

Enter **1** at the Create/Edit Page Layouts menu and press **ENTER**. A panel similar to this appears:

**Xerox Output Administrative Facility**  
**Edit Global Specifications**

COMMAND ==>

Page Layout Name: PL0001

Width: 7.5

Height: 10

Unit Measure (CM/DOT/IN/MM): IN

Margin: 0

LPI: 6

Complete these fields and press **ENTER**:

| <b>COUNT</b>           | <p>Enter the number of lines in the input data stream to be formatted using these parameters. This is a function of the LPI value and the logical page dimensions.</p> <p>If you are using conditional formatting, each line in this group will be tested for the condition(s) you have defined.</p> <p>Valid values: A number between 1 and the maximum number of lines that will fit on the page.</p> <p>Default: 60</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>POSITION ACROSS</b> | <p>Enter the line starting position relative to the left edge of the logical page. The units entered in the global parameters are used for this column.</p> <p>Valid values:</p> <p><i>value</i> A horizontal offset from the left edge of the logical page, not the margin. This value cannot exceed the page width.</p> <p><b>MARGIN</b> Indicates that the starting point is controlled by the margin specified in the global parameters.</p> <p>Default: MARGIN</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>POSITION DOWN</b>   | <p>Enter the line starting position relative to the top of the logical page. The units entered in the global parameters are used for this column.</p> <p>Valid values:</p> <p><i>value</i> A decimal value that does not exceed the page height.</p> <p><b>TOP</b> The baseline is positioned at 80 percent of one interline space below the top of the printable area.</p> <p>For example, if LPI = 6, the interline spacing equals .16667 inch. Therefore, the baseline of the first line = .16667 × .8 (or .133336) inches from the top of the page.</p> <p><b>NEXT</b> The baseline is advanced from the baseline of the previous line by the amount of the interline spacing.</p> <p>For example, assume that the last line baseline is 2 inches from the top. If LPI = 6, the interline spacing equals .16667 inch. Therefore, the baseline of the next line would be 2 + .16667 (or 2.16667) inches.</p> <p>Default: TOP</p> |
| <b>LPI</b>             | <ul style="list-style-type: none"> <li>Enter the number of lines per inch for this line group, using a number that divides evenly into 300. This avoids dealing in fractional dots, which can produce unpredictable results.</li> </ul> <p>This value overrides the LPI specified on the Edit Global Specifications panel.</p> <ul style="list-style-type: none"> <li>Leave this column blank if you want the system to default to the value specified in the 'LPI' field on the Edit Global Specifications panel.</li> </ul> <p>Default: 6</p>                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>END GROUP</b> | <p>Specify whether this is the end of a line group for conditional formatting purposes. For more information about how line groups are used in conditional formatting, refer to chapter 51, "<a href="#">Page format overview</a>."</p> <p>Valid values:</p> <p>YES      Specifies the end of a line group.</p> <p>NO        Specifies that this is not the end of a line group.</p> <p>Default: NO</p> |

## Specifying a field format

After you enter E in the 'OPT' column and a name in the 'FIELD FORMAT' column on the Edit Line Data Specifications panel, a panel similar to this appears:

Xerox Output Administrative Facility   Row 1 to 1 of 1

Edit a Field Format

COMMAND ==>
SCROLL ==> PAGE

\* In OPTION column, enter 'E' to edit a constant string.

\* In OPTION column, enter 'I' to insert, 'R' to repeat, or 'D' to delete a line.

Field Format: DEAL

Unit Measure: IN

LPI: 6

| <b>CONSTANT</b> | <p>Indicate whether this field is associated with a constant string or a field in an input data stream.</p> <p>Valid values:</p> <p>YES     This field is associated with a constant string. You must leave the 'INPUT START' and 'INPUT LENGTH' columns blank. If you enter YES, you must define the constant string for this field. Refer to <a href="#">“Creating/Editing a constant string”</a> later in this chapter for details.</p> <p>NO     This field is associated with a field in an input data stream.</p> <p>Default: NO</p> |

## Creating/Editing a constant string

After you enter E in the 'OPTION' column of the field for which you are setting up a constant string, a panel similar to this appears.

**Xerox Output Administrative Facility**  
**Edit a Constant String**

COMMAND ==>

Field Format: DEAL

Type (C/X): C

Delimiter: @

String: SALESPERSON @ \_\_\_\_\_

Complete these fields and press **ENTER**:

| Field               | Column                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Format</b> | This field displays the name of the field format for which you are setting up a constant string.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Type</b>         | <p>Specify the type of data entered in the 'String' field.</p> <p>Valid values:</p> <ul style="list-style-type: none"> <li>C Character.</li> <li>X Hexadecimal character. This is useful for including characters in your string that are not available on your keyboard.</li> </ul> <p>Default: C</p>                                                                                                                                                                 |
| <b>Delimiter</b>    | <p>Enter the character to be used as the string delimiter. You must use a character that is not contained in your printed constant string. When encountered in a constant string, the character is interpreted as the end of the string. This delimiter is required only if you want to pad your constant string with space characters. This field is not applicable for hexadecimal character strings, where embedded spaces are not permitted.</p> <p>Default: @</p> |

| Field  | Column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| String | <p>Enter the literal that you want printed as a constant for this field. The system prints this information in the position described by the field format. To leave space characters after the literal, enter the delimiter character you specified in the 'Delimiter' field at the end of the series of space characters. For example, the Edit a Constant String panel shows the constant "SALESPERSON" padded by five spaces, then the delimiter @.</p> <p>This field is case sensitive, so be sure to enter the constant string exactly as you want it to appear in your output. All alphanumeric characters and special characters are allowed except the ampersand ( &amp; ).</p> <p> <b>NOTE:</b> For a hexadecimal string, you must enter an even number of characters because each EBCDIC character is composed of two hexadecimal digits.</p> |

After you set up a constant string for a field, you can activate or deactivate it by entering YES or NO in the 'CONSTANT' column on the Edit a Field Format panel.

## Selecting conditional formatting

After you enter C in the 'OPT' column of the line group for which you are setting up conditional formatting, a panel similar to this appears:

**Xerox Output Administrative Facility Row 1 to 2 of 2**  
**Edit Conditional Formatting Parameters**

COMMAND ===> SCROLL ===> PAGE

\* In OPTION column, enter 'I' to insert, 'E' to edit, or 'D' to delete a condition ID.

Page Layout Name: PL0001

| OPTION | CONDITION ID |
|--------|--------------|
| —      | CONDA1__     |
| —      | CONDA2__     |

Complete these fields and press **ENTER**:

| Field/Column            | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Page Layout Name</b> | This field displays the name of the page layout you are editing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>OPTION</b>           | <p>Specify the function you want to perform.</p> <p>Valid values:</p> <ul style="list-style-type: none"> <li>I Adds a blank line below this line. You must enter a value in the 'CONDITION ID' column to save the inserted line.</li> <li>E Edits a condition ID. The Edit Conditional Formatting Parameters panel appears.</li> <li>D Deletes a condition ID from the list.</li> </ul>                                                                                                                                                                                                                                                                                                                                      |
| <b>CONDITION ID</b>     | <ul style="list-style-type: none"> <li>• If you are creating a new page format, this panel displays a single condition ID named DEFAULT. This is the default condition ID that is provided with XPAP. Type over this name with the 1- to 8-character name of the condition ID you are creating. This must be a unique name that begins with an alphabetic character (A–Z), @, #, or \$. You can set up a maximum of 25 conditional IDs per line group.</li> <li>• If you are editing a page format, this panel displays the existing condition IDs in the order in which you entered them.</li> <li>• If you insert or repeat a line, enter the new condition ID name typing over the existing name if necessary.</li> </ul> |

## Specifying conditional formatting parameters

After you enter E in the 'OPTION' column of the Edit Conditional Formatting Parameters panel, a panel similar to this appears:

Xerox Output Administrative Facility    Row 1 to 2 of 2

Edit Conditional Formatting Parameters

COMMAND ==>
SCROLL ==> PAGE

\* In OPTION column, enter 'E' to edit comparison text.  
 \* In OPTION column, enter 'I' to insert, 'R' to repeat, or 'D' to delete a line.

Condition ID: CONDA1

Start Position: 1

Length: 20

| OPTION | TYPE | B/A | L/G | COPY MODIFICATION NAME | PAGE LAYOUT NAME |
|--------|------|-----|-----|------------------------|------------------|
| —      | EQ   | B   | G   | CURRENT_               | NULL_____        |
| —      | LT   | A   | G   | CM002_____             | PL002_____       |

Complete these fields and press **ENTER**:

| Field/Column          | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| NEXT                          | Uses the next copy modification in the page format. If NEXT is called from the last copy modification in the page format, the first copy modification in the page format is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |             |                                                                                              |              |                                          |       |                                                        |      |                                                                                                                                                                                   |           |                                                                                                     |
| NULL or /                     | Continues using the current copy modification and continues printing on the current physical sheet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |             |                                                                                              |              |                                          |       |                                                        |      |                                                                                                                                                                                   |           |                                                                                                     |
| <b>PAGE LAYOUT NAME</b>       | <p>Identify the page layout to be used if the condition is true.</p> <p>Valid values:</p> <table> <tr> <td><i>name</i></td><td>Uses the named page layout. The page layout must be defined in this page format.</td></tr> <tr> <td>CURRENT or =</td><td>Use the current page layout again.</td></tr> <tr> <td>FIRST</td><td>Uses the first page layout in the current page format.</td></tr> <tr> <td>NEXT</td><td>Uses the next page layout in the current page format. If NEXT is called from the last page layout in the page format, the first page layout in the page format is used.</td></tr> <tr> <td>NULL or /</td><td>Continues using the current page layout and continues printing on the current sheet.</td></tr> </table> <p>Default: NULL</p> <p> <b>NOTE:</b> Any value except NULL or slash ( / ) causes printing to begin on the first logical page of the next physical sheet.</p> <p>To skip to the front of a new sheet when printing duplex, specify CURRENT for the copy modification and NULL for the page layout. To skip to a new side of a page when printing duplex, specify NULL for the copy modification and CURRENT for the page layout.</p> | <i>name</i> | Uses the named page layout. The page layout must be defined in this page format.             | CURRENT or = | Use the current page layout again.       | FIRST | Uses the first page layout in the current page format. | NEXT | Uses the next page layout in the current page format. If NEXT is called from the last page layout in the page format, the first page layout in the page format is used.           | NULL or / | Continues using the current page layout and continues printing on the current sheet.                |
| <i>name</i>                   | Uses the named page layout. The page layout must be defined in this page format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |             |                                                                                              |              |                                          |       |                                                        |      |                                                                                                                                                                                   |           |                                                                                                     |
| CURRENT or =                  | Use the current page layout again.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |             |                                                                                              |              |                                          |       |                                                        |      |                                                                                                                                                                                   |           |                                                                                                     |
| FIRST                         | Uses the first page layout in the current page format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |             |                                                                                              |              |                                          |       |                                                        |      |                                                                                                                                                                                   |           |                                                                                                     |
| NEXT                          | Uses the next page layout in the current page format. If NEXT is called from the last page layout in the page format, the first page layout in the page format is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |             |                                                                                              |              |                                          |       |                                                        |      |                                                                                                                                                                                   |           |                                                                                                     |
| NULL or /                     | Continues using the current page layout and continues printing on the current sheet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |             |                                                                                              |              |                                          |       |                                                        |      |                                                                                                                                                                                   |           |                                                                                                     |

## Creating/editing comparison text

After you enter E in the 'OPTION' column of the Edit Conditional Formatting Parameters panel, a panel similar to this appears:

Xerox Output Administrative Facility
Row 1 to 1 of 1

Edit Comparison Text

COMMAND ==>
SCROLL ==> PAGE

\* In OPT column, enter 'I' to insert, 'R' to repeat, or 'D' to delete a line.

Condition ID: CONDA1

OPT COMPARISON TEXT

\_ TEST TEXT \_\_\_\_\_

Complete these fields and press **ENTER**:

| Field/Column           | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Condition ID</b>    | This field displays the condition ID for which you are editing comparison text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>OPT</b>             | Enter the letter that corresponds to the function you want to perform.<br>Valid values: <ul style="list-style-type: none"> <li>I Inserts a line below this line of text.</li> <li>R Repeats a line of text in the string.</li> <li>D Deletes this line of text from the string.</li> </ul>                                                                                                                                                                                                                                                                |
| <b>COMPARISON TEXT</b> | Enter the text to be compared with the field in your input data stream. You can enter a maximum of 700 characters. No quotes are necessary. All characters except the ampersand character ( & ) are allowed.<br><br>If you entered CH or OT in the 'COMPARISON TYPE' column on the previous panel, do not enter any comparison text.<br><br>The values entered for this column must be case sensitive. Enter the same combination of uppercase and lowercase characters here that you expect to find in your input data stream.<br><br>Default: TEST TEXT |

When you reach the end of a line, the text editor does not automatically wrap. You must insert a new line. You also must ensure there is a space between the last character on a line and the first character on the next line. If you do not insert the space, the system recognizes the last word on a line and the first word on the next line as a single word.

## Specifying font list parameters

As an alternative to specifying fonts for each line in a page layout, you can select fonts through font lists coupled with a font index contained in the input data stream. Only Xerox fonts can be used with the page format editor.

The font index is entered in the second column of the input data stream. Each font index references a Xerox font in a font list that is associated with a page layout. Within a font list, you can set up 127 unique font indexes.

If you use font indexing to select your fonts, you can change fonts only with each subsequent line of your input data stream. You cannot also specify a different font for an individual field within the line.

For each font you specify, you must execute option 4, Update Xerox Font Characteristics Information, on the Xerox Page Format Editor menu to convert Xerox font characteristics. For instructions on using this option, refer to chapter 59, [“Updating Xerox font characteristics information.”](#)

You must edit your JCL so that the font index byte is recognized in your input data stream. The font index byte must be in the byte immediately following the carriage control byte. You must also include one of the following IBM JCL keywords in the JCL:

- TRC=YES (on the OUTPUT statement)
- DCB=OPTCD=J (on the DD statement)

## Editing a font list

Enter **3** at the Create/Edit Page Layouts menu OPTION line and press **ENTER**. A panel similar to this appears:

Xerox Output Administrative Facility    Row 1 to 2 of 2  
 Edit a Font List

COMMAND ===>
SCROLL ===> PAGE

\* In OPTION column, enter 'I' to insert or 'D' to delete a line.

Page Layout Name: PL0001

| OPTION | FONT INDEX | FONT   |
|--------|------------|--------|
| —      | __0        | UN104E |
| —      | _10        | UN104A |
| —      | _____      | _____  |

Complete these fields and press **ENTER**:

| Field/Column            | Action                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Page Layout Name</b> | This field identifies the page layout for which you are creating or editing a font list.                                                                                                                                                                                                                                                                        |
| <b>OPTION</b>           | <p>Enter the letter that corresponds to the function you want to perform.</p> <p>Valid values:</p> <ul style="list-style-type: none"> <li>I Inserts a line below this line in the list. For the line to be saved, you must enter a valid font index and Xerox font name.</li> <li>D Deletes this line from the font list.</li> </ul>                            |
| <b>FONT INDEX</b>       | <p>Enter a unique font index value by which this Xerox font will be referenced in your input data stream.</p> <p>Valid values: 0 through 126.</p> <p>You can enter the font index values in any order; when you press ENTER or enter END, the system automatically sorts them in ascending numerical order. Use the scroll keys to scroll through the list.</p> |
| <b>FONT</b>             | Enter the 1- to 6-character name of the Xerox font to be associated with the font index.                                                                                                                                                                                                                                                                        |

## 57. Generating a page format

This chapter describes how to generate a page format.

### Generation procedure

---

Before you can use a page format, you must compile the source into a machine readable format using this procedure:

- Step 1.** Enter **2** at the Xerox Page Format Editor menu OPTION line and press **ENTER**. A panel similar to this appears:

Xerox Output Administrative Facility  
Maintain Page Formats

OPTION ==>

1. Create/Edit a Page Format
2. Generate a Page Format

Page Format Name:

Page Format Library Name:

- Step 2.** Enter **2** in the menu OPTION line.

- Step 3.** If you know the name of the page format you want to generate, enter the 1- to 8-character name in the 'Page Format Name' field.

If you do not know the exact name, leave the 'Page Format Name' field blank or enter the first few characters of the name followed by an asterisk ( \* ), then press **ENTER**.

A panel similar to this appears and displays a list of the existing page formats that match the name pattern you entered:

```

MEMBER LIST ----- ROW 00001 OF 00008
COMMAND ===> SCROLL ===> PAGE
 Name VV.MM Created Changed Size Init Mod ID
DFLT1
FMFTA
FMTB
FMTC
FMTD
LO002
LO003
LO004
END

```

Enter **S** to the left of the page format you want to generate, then press **ENTER**.

**Step 4.** In the 'Page Format Library Name' field, enter the name of the library in which you want to store the generated page format and press **ENTER**. If you do not enclose the library name in single quotes, the system automatically prefixes it with your user ID.

After the system has generated the page format, it displays a confirmation message. The system stores the generated page format in the page format library. This is the library specified in the XOSF start-up proc DD statement named by the PGFRMDD initialization parameter or the PAGEFORMLIB printer profile parameter. Refer to [Section Five: XPAF Parameter and Keyword Reference](#) for information about these parameters.

The generated page format cannot be edited online. To make changes, you must edit the page format source, then regenerate it. For the changes to take effect, you must drain your XOSF-controlled printers, then restart them.

## 58. Copying page format source members

This chapter describes how to copy a page format's source members. This is useful when, for example, you want to copy a page format from test libraries to production libraries.

From the following datasets, you can copy all members that make up the page format:

- COND
- CPMOD
- FIELD
- FLIST
- LINED
- PLIST

You can rename the page format during the copy and store the copied members in different datasets.

### Specifying the copy source

---

Enter **3** at the Xerox Page Format Editor menu OPTION line and press **ENTER**. A panel similar to this appears:

Xerox Output Administrative Facility  
Copy Page Format Source Members

COMMAND ===>

INPUT

Dataset Prefix:

Page Format Name:

OUTPUT

Dataset Prefix:

Page Format Name:

Complete these fields and press **ENTER**:

| Field                                  | Action                                                                                                                                                                    |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>INPUT</b><br><b>Dataset Prefix</b>  | Enter the prefix of the datasets where the page format source to be copied resides. Do not enclose the prefix in quotes.                                                  |
| <b>Page Format Name</b>                | Enter the 1- to 8-character name of the page format whose source members you want to copy.                                                                                |
| <b>OUTPUT</b><br><b>Dataset Prefix</b> | Enter the prefix of the datasets in which you want to store the copied members. These datasets must be allocated before performing the copy.                              |
| <b>Page Format Name</b>                | Enter the 1- to 8-character name by which you want the copied version of the page format known. The name can be the same as or different from the input page format name. |

## 59. Updating Xerox font characteristics information

This chapter describes how to update the XPAF EBCDIC font widths (XPAFEFW) table and EBCDIC-to-ASCII (XPAFE2A) table with information that is needed to position characters correctly at print time. When using Xerox fonts in a page-formatted document, XPAF uses centralized font dimensions to position both centralized and decentralized font characters on the page.

After loading a new centralized font or converting a centralized font to a decentralized font, you must execute the Update Xerox Font Characteristics Information option or CONVERT FONT TSO/batch command before you use either a centralized or decentralized version of the font in a page-formatted document.

---

**NOTE:** This conversion requires a region of at least eight megabytes to run successfully.

---

For a complete list of available Xerox centralized fonts, refer to Xerox Laser Printing Systems Standard Font Library Font User Guide. For more information about the XPAFEFW and XPAFE2A tables, refer to [Section Three: Managing Resources with XPAF](#).

### Specifying font characteristics

---

Enter **4** at the Xerox Page Format Editor menu OPTION line and press **ENTER**. A panel similar to this appears:

**Xerox Output Administrative Facility**  
**Update Xerox Font Characteristics Information**

COMMAND ===>

Dataset Name:

Logical Font Name:

Complete these fields and press **ENTER**:

| Field                    | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dataset Name</b>      | <p>Enter the name of the PDS or native centralized font library in which the font is stored. The dataset specifications are:</p> <p>RECFM=F or FB<br/> LRECL=128<br/> BLKSIZE=A value appropriate for your site</p>                                                                                                                                                                                                                                                              |
| <b>Logical Font Name</b> | <ul style="list-style-type: none"> <li>Enter the 1- to 6-character name of the Xerox centralized font that you want to use in a page-formatted document. The name must match the logical font name in the Xerox font information (XPAFXFI) table. For more information about the XPAFXFI table, refer to <a href="#">Section Three: Managing Resources with XPAF</a>.</li> <li>Enter an asterisk ( * ) to convert all fonts in the PDS or native centralized library.</li> </ul> |

### TSO batch command

You can use this TSO/batch command as an alternative to using the Update Xerox Font Characteristics Information option:

```

CONVERT FONT('input-dataset-name({ member-name })')
 *
```

Refer to the *XPAF TSO/Batch Commands Quick Reference Card* for information about other commands you can use.

## 60. Page format examples

This chapter illustrates several ways in which you can use the page format editor to format documents. It provides these examples:

- A list report which illustrates how to create global and line data specifications and steps you through the process of setting up a copy modification
- A statement report which illustrates field formatting and printing the same data multiple times on the report
- Mail merging which illustrates conditional processing and shows you how to use comparison text to test for a particular condition

A full explanation of the fields shown in the examples can be found in earlier chapters of Section Eight.

### List report

---

This example illustrates a page format that can be used to print a simple list report.

### Assumptions

---

Assume you want to format a report that lists phone calls by department and within department by extension. The report prints each extension beginning on a separate page.

- The report is printed on 8.5 by 11 inch paper in portrait orientation.
- The logical page is offset 0 inches across and 0.75 inches down from the physical page origin. The logical page is 7 by 10 inches, with a 1.5 inch margin.
- For each department there are three title lines, which are positioned at the top of the logical page:
  - Line one contains the company name. It also contains a skip-to-channel 1 code.
  - Line two contains the report title and the month and year it was produced.
  - Line three contains the department name and extension number.
- There is one column heading line, which is positioned 1.25 inches down from the top of the logical page and aligned with the margin.
- There may be up to 45 detail records per page. The detail records are positioned 1.5 inches down from the top of the logical page and are aligned with the margin.
- All data is printed in font P07TYA.

The input data stream format is shown in figure 60-1. A sample phone call log report is shown in figure 60-2.

Figure 60-1. Phone call log report input data stream

| 06/17 | 305-896-0700  | 8:32  | 8.17  | 1.80   |
| 06/17 | 561-222-6363  | 8:54  | 11.22 | 2.47   |
| 06/18 | 305-896-2282  | 11:47 | 2.51  | .56    |
| 06/26 | 407-804-9542  | 3:31  | 6.36  | 1.40   |
| 06/26 | 813-636-2459  | 3:41  | 4.41  | .98    |
| 06/27 | 305-896-1166  | 9:19  | 5.52  | 1.22   |
| 06/27 | 305-896-1200  | 11:06 | 15.08 | 3.32   |

## Page format values

---

To print the phone call log report using the input data shown in figure 60-1, you would create a page format with the following values. Assume the page format is called REPORT.

- Step 1.** Access the page format editor (XOAF option P).
- Step 2.** On the Xerox Page Format Editor menu panel, select option **2**. Press **ENTER**.
- Step 3.** On the Maintain Page Formats panel, enter **1** on the COMMAND line and **REPORT** in the 'Page Format Name' field. Press **ENTER**.
- Step 4.** On the Create/Edit a Page Format panel, select option **1**. Press **ENTER**.
- Step 5.** On the Create/Edit Copy Modifications panel, enter **E** in the 'OPTION' column and **REPORT** in the 'COPY MODIFICATION NAME' column. Press **ENTER**.
- Step 6.** Make these entries on the Create/Edit Copy Modifications panel:

---

---

```

Unit Measure (CM/DOT/IN/MM): IN
Page Origin Across: 0
Page Origin Down: 0.75
Number of Copies (1 to 255): 1
Duplex Mode (YES/NO): NO
Tray Number (1 to 9): 1
Cluster Name:
Form Name for Front:
Form Name for Back:
BFORM Name:
Report Stacking (YES/NO): NO
Split Report (YES/NO): NO
Front Shift Value (-75 to 75): 0
Back Shift Value (-75 to 75): 0
Signal Function 1 (YES/NO): NO
Signal Function 2 (YES/NO): NO
Separator Page First (YES/NO): NO

```

---

---

Press **ENTER**, then press **PF3** twice.

- Step 7.** On the Create/Edit a Page Format menu panel, enter **2** in the COMMAND line and press **ENTER**.
- Step 8.** On the Create/Edit Page Layouts panel, enter **E** in the 'OPTION' column, **REPORT** in the 'PAGE LAYOUT NAME' column, and **PORTRAIT** in the 'ORIENTATION' column. Press **ENTER**.
- Step 9.** On the Create/Edit Page Layouts menu panel, select option **1**. Press **ENTER**.

**Step 10.** Make these entries on the Edit Global Specifications panel:

|                                 |
|---------------------------------|
| Width: 7                        |
| Height: 10                      |
| Unit Measure (CM/DOT/IN/MM): IN |
| Margin: 1.5                     |
| LPI: 6                          |

Press **ENTER**, then press **PF3**.

**Step 11.** On the Create/Edit Page Layouts menu panel, select option **2**. Press **ENTER**.

**Step 12.** Repeat the line data shown on the panel twice and make these entries on the Edit Line Data Specifications panel:

| POSITION |       | FIELD       |      | END |        |      |        |                |
|----------|-------|-------------|------|-----|--------|------|--------|----------------|
| OPT      | COUNT | ACROSS      | DOWN | LPI | CHAN   | FONT | FORMAT | COL COND GROUP |
| 3        |       | MARGIN TOP  | 6    | 1   | P07TYA |      | DEF NO | NO             |
| 1        |       | MARGIN 1.25 | 6    |     | P07TYA |      | DEF NO | NO             |
| 45       |       | MARGIN 1.5  | 6    |     | P07TYA |      | DEF NO | NO             |

Press **ENTER**. Then press **PF3** until you return to the Maintain Page Formats panel.

**Step 13.** On the Maintain Page Formats panel, enter **2** on the COMMAND line, **REPORT** in the 'Page Format Name' field, and your page format library name in the 'Page Format Library Name' field. Press **ENTER**.

The page format is generated and stored in your page format library. This is the library specified in the XOSF start-up proc DD statement named by the PGFRMDD initialization parameter or the PAGEFORMLIB printer profile parameter. You can now submit a job using this page format by specifying PAGEFORM=REPORT in your extended JCL.

## Statement report

---

This example illustrates a page format that merges customer data with a statement form.

### Assumptions

---

A medical insurance company prints statements of employee benefits for claims filed with their office. They have created a standard statement of benefit form called INSTMT. The form is 8.5 by 11 inches and is portrait. It is designed as a tri-fold with a window for the employee's mailing address. A detachable check prints in the lower third of the form.

- The logical page is offset 0.0 inches across and 0.0 inches down from the physical page origin. The logical page dimensions are 8.5 by 11.0 inches.
- The input data stream contains the variable data for each claim.
- The data is printed in font P07TCB.
- The employee name appears in the data stream once; however, it is printed on the statement three times.
- The employee address appears in the data stream once; however, it is printed on the statement three times.
- Up to eight individual "services" can be listed.
- Up to six lines of notes can be printed below the address window.

The input data stream format is shown in figure 60-3. A sample claims statement is shown in figure 60-4.

## Page format values

---

To print the claims statement of benefits illustrated in figure 60-4 using the form INSTMT and the input data shown in figure 60-3, you would create a page format with the following values. Assume the page format is called INSTMT.

- Step 1.** Access the page format editor (XOAF option P).
- Step 2.** On the Xerox Page Format Editor menu panel, select option **2**. Press **ENTER**.
- Step 3.** On the Maintain Page Formats panel, enter **1** on the COMMAND line and **INSTMT** in the 'Page Format Name' field. Press **ENTER**.
- Step 4.** On the Create/Edit a Page Format panel, select option **1**. Press **ENTER**.
- Step 5.** On the Create/Edit Copy Modifications panel, enter **E** in the 'OPTION' column and **INSTMT** in the 'COPY MODIFICATION NAME' column. Press **ENTER**.
- Step 6.** Make these entries on the Create/Edit Copy Modifications panel:

---

---

Unit Measure (CM/DOT/IN/MM): **IN**  
 Page Origin Across: **0.0**  
 Page Origin Down: **0.0**  
 Number of Copies (1 to 255): **1**  
 Duplex Mode (YES/NO): **NO**  
 Tray Number (1 to 9): **1**  
 Cluster Name:  
 Form Name for Front: **INSTMT**  
 Form Name for Back:  
 BFORM Name:  
 Report Stacking (YES/NO): **NO**  
 Split Report (YES/NO): **NO**  
 Front Shift Value (-75 to 75): **0**  
 Back Shift Value (-75 to 75): **0**  
 Signal Function 1 (YES/NO): **NO**  
 Signal Function 1 (YES/NO): **NO**  
 Separator Page First (YES/NO): **NO**

---

---

Press **ENTER**, then press **PF3** twice.

- Step 7.** On the Create/Edit a Page Format menu panel, enter **2** in the COMMAND line and press **ENTER**.
- Step 8.** On the Create/Edit Page Layouts panel, enter **E** in the 'OPTION' column, **INSTMT** in the 'PAGE LAYOUT NAME' column, and **PORTRAIT** in the 'ORIENTATION' column. Press **ENTER**.
- Step 9.** On the Create/Edit Page Layouts menu panel, select option **1**. Press **ENTER**.

**Step 10.** Make these entries on the Edit Global Specifications panel:

---

---

Width: **8.5**

Height: **11**

Unit Measure (CM/DOT/IN/MM): **IN**

Margin: **0**

LPI: **6**

---

---

Press **ENTER**, then press **PF3**.

**Step 11.** On the Create/Edit Page Layouts panel, select option **2**. Press **ENTER**.

**Step 12.** Repeat the line displayed on the panel nine times and make these entries on the Edit Line Data Specifications panel:

---

---

| - | 62     | 7     | 5.90   | 2.35   | A     | _____ | DEF  | NO    |          |  |  |  |
| - | 59     | 1     | 5.70   | 2.35   | A     | _____ | DEF  | NO    |          |  |  |  |
| - | 73     | 7     | 6.70   | 2.35   | A     | _____ | DEF  | NO    |          |  |  |  |
| - | 84     | 7     | 7.50   | 2.35   | A     | _____ | DEF  | NO    |          |  |  |  |

---

Press **ENTER**, then press **PF3**.

- Step 25.** Enter **E** in the 'OPT' column for line group 7 to edit the field format SUBTOT. Press **ENTER**.

- Step 26.** Repeat the line displayed on the panel four times and make these entries on the Edit a Field Format panel:

---

Unit Measure: **IN**

LPI: **6**

|   | INPUT  |       | OUTPUT |        | PRINT |       |      |       |          |  |  |  |
|---|--------|-------|--------|--------|-------|-------|------|-------|----------|--|--|--|
|   | OPTION | START | LENGTH | ACROSS | DOWN  | DIR   | FONT | COLOR | CONSTANT |  |  |  |
| - | 40     | 7     | 4.145  | 3.61   | A     | _____ | DEF  | NO    |          |  |  |  |
| - | 51     | 7     | 4.94   | 3.61   | A     | _____ | DEF  | NO    |          |  |  |  |
| - | 62     | 7     | 5.90   | 3.61   | A     | _____ | DEF  | NO    |          |  |  |  |
| - | 73     | 7     | 6.70   | 3.61   | A     | _____ | DEF  | NO    |          |  |  |  |
| - | 84     | 7     | 7.50   | 3.61   | A     | _____ | DEF  | NO    |          |  |  |  |

---

Press **ENTER**, then press **PF3**.

- Step 27.** Enter **E** in the 'OPT' column for line group 8 to edit the field format TOTALS. Press **ENTER**.

- Step 28.** Repeat the line displayed on the panel three times and make these entries on the Edit a Field Format panel:

---

Unit Measure: **IN**

LPI: **6**

|        | INPUT |        | OUTPUT |      | PRINT |      |       |          |  |  |  |
|--------|-------|--------|--------|------|-------|------|-------|----------|--|--|--|
| OPTION | START | LENGTH | ACROSS | DOWN | DIR   | FONT | COLOR | CONSTANT |  |  |  |
| -      | 6     | 11     | 7.00   | 4.62 | A     |      | DEF   | NO       |  |  |  |
| -      | 19    | 11     | 7.00   | 4.77 | A     |      | DEF   | NO       |  |  |  |
| -      | 30    | 11     | 7.00   | 4.96 | A     |      | DEF   | NO       |  |  |  |
| -      | 30    | 11     | 6.60   | 9.10 | A     |      | DEF   | NO       |  |  |  |

---

Press **ENTER**. Then press **PF3** until you return to the Maintain Page Formats panel.

- Step 29.** On the Maintain Page Formats panel, enter **2** on the COMMAND line, **INSTMT** in the 'Page Format Name' field, and your page format library name in the 'Page Format Library Name' field. Press **ENTER**.

The page format is generated and stored in your page format library. This is the library specified in the XOSF start-up proc DD statement named by the PGFRMDD initialization parameter or the PAGEFORMLIB printer profile parameter. You can now submit a job using this page format by specifying PAGEFORM=INSTMT in your extended JCL.

## Mail merge

---

This example illustrates a page format that merges names and addresses with one of two form letters.

### Assumptions

---

The Rainbow Office Supplies company is offering a promotional special to new customers in the areas served by its two locations: Sunshine Parkway and East Beach Drive. They have created two letters as forms:

- LTR1 asks recipients in ZIP code areas beginning with 329 to visit the East Beach Drive location. Refer to figure 60-2.
- LTR2 asks recipients in ZIP code areas beginning with 331 to visit the Sunshine Parkway location.
- Each form is 8.5 by 11 inches.
- The letter is printed on 8.5 by 11 inch paper in portrait orientation.
- The logical page is offset 0 inches across and 0.5 inches down from the physical page origin. The logical page dimensions are 7.5 by 10 inches, with a 0.75 inch margin.
- The input data stream contains the date and name and mailing address for each recipient.
- The names and addresses are printed in font PR110E.
- The name is printed in two locations on the letter: in the mailing address and the salutation.
- Conditional processing tests the ZIP code to determine which form is merged with an individual address.

The input data stream format is shown in figure 60-1. A sample form letter is shown in figure 60-2. Sample JCL including this data is included in the XPFSAMP library member LETTER.

*Rainbow Office Supplies  
P.O. Box 2112  
123 Sunshine Parkway*

Dear

Congratulations on your recent purchase of computer printer supplies. We at Rainbow Office Supplies are sure you will enjoy the high quality of the products and services that we offer.

We would welcome the opportunity for you to meet with a member of our professional staff to discuss your office's requirements. Our highly trained experts have over 25 years of experience assisting individuals and businesses in determining the most cost-effective products available to meet their personal and/or organizational needs.

Rainbow Office Supplies has long-established relationships with the leading manufacturers of office supplies, thereby ensuring you the shortest delivery time possible for quality products and services.

We would like to extend to you a one-time offer of a 40% discount on any copier or printer supplies that you purchase within the next 60 days. To take advantage of this special offer, take the attached coupon to the location identified on the coupon and present it with your purchase. We look forward to helping you fulfill all of your office supply needs.

Sincerely,

Sarah Chen  
Senior Sales Representative

## Page format values

---

To merge the data shown in figure 60-1 with the appropriate form letter, you would create a page format with the following values. Assume the page format is called LETTER.

- Step 1.** Access the page format editor (XOAF option P).
- Step 2.** On the Xerox Page Format Editor panel, select option **2**, Maintain Page Formats. Press **ENTER**.
- Step 3.** On the Maintain Page Formats panel, enter **1**, Create/Edit a Page Format, in the COMMAND line and **LETTER** in the 'Page Format Name' field. Press **ENTER**.
- Step 4.** On the Create/Edit a Page Format menu option line, select option **1**, Create/Edit Copy Modifications, and press **ENTER**.
- Step 5.** On the Create/Edit Copy Modifications selection panel, enter **E** in the 'OPTION' column, and **LTR1** in the 'COPY MODIFICATION NAME' column. Press **ENTER**.
- Step 6.** Make these entries on the Create/Edit Copy Modifications data panel:

---

---

Unit Measure (CM/DOT/IN/MM): **IN**  
 Page Origin Across: **0**  
 Page Origin Down: **0.5**  
 Number of Copies (1 to 255): **1**  
 Duplex Mode (YES/NO): **NO**  
 Tray Number (1 to 9): **1**  
 Cluster Name:  
 Form Name for Front: **LTR1**  
 Form Name for Back:  
 BFORM Name:  
 Report Stacking (YES/NO): **NO**  
 Split Report (YES/NO): **NO**  
 Front Shift Value (-75 to 75): **0**  
 Back Shift Value (-75 to 75): **0**  
 Signal Function 1 (YES/NO): **NO**  
 Signal Function 2 (YES/NO): **NO**  
 Separator Page First (YES/NO): **NO**

---

---

Press **ENTER**, then press **PF3**.

- Step 7.** On the Create/Edit Copy Modifications selection panel, enter **I** in the 'OPTION' column. Press **ENTER**.
- Step 8.** Enter **E** in the 'OPTION' column and **LTR2** in the 'COPY MODIFICATION NAME' column. Press **ENTER**.

**Step 9.** Make these entries on the Create/Edit Copy Modifications data panel:

---

---

Unit Measure (CM/DOT/IN/MM): **IN**  
 Page Origin Across: **0**  
 Page Origin Down: **0.5**  
 Number of Copies (1 to 255): **1**  
 Duplex Mode (YES/NO): **NO**  
 Tray Number (1 to 9): **1**  
 Cluster Name:  
 Form Name for Front: **LTR2**  
 Form Name for Back:  
 BFORM Name:  
 Report Stacking (YES/NO): **NO**  
 Split Report (YES/NO): **NO**  
 Front Shift Value (-75 to 75): **0**  
 Back Shift Value (-75 to 75): **0**  
 Signal Function 1 (YES/NO): **NO**  
 Signal Function 2 (YES/NO): **NO**  
 Separator Page First (YES/NO): **NO**

---

---

Press **ENTER**, then press **PF3** twice.

**Step 10.** On the Create/Edit a Page Format panel, enter **2**, Create/Edit page Layouts, in the COMMAND line. Press **ENTER**.

**Step 11.** On the Create/Edit Page Layouts selection panel, enter **E** in the 'OPTION' column, **LETTER** in the 'PAGE LAYOUT NAME' column, and **PORTRAIT** in the 'ORIENTATION' column. Press **ENTER**.

**Step 12.** On the Create/Edit Page Layouts menu panel, select option **1**, Edit Global Specifications. Press **ENTER**.

**Step 13.** Make these entries on the Edit Global Specifications panel:

---

---

Width: **7.5**  
 Height: **10.0**  
 Unit Measure (CM/DOT/IN/MM): **IN**  
 Margin: **0.75**  
 LPI: **6**

---

---

Press **ENTER**, then press **PF3**.

**Step 14.** On the Create/Edit Page Layouts menu panel, select option **2**, Edit Line Data Specifications. Press **ENTER**.

- Step 15.** Repeat the line displayed on the panel three times and make these entries on the Edit Line Data Specifications selection panel:

| POSITION |       | FIELD  |      | END |        |        |            |                |
|----------|-------|--------|------|-----|--------|--------|------------|----------------|
| OPT      | COUNT | ACROSS | DOWN | LPI | CHAN   | FONT   | FORMAT     | COL COND GROUP |
| 1        | 1     | TOP    | 6    | 1   | UB110E |        | DEF NO NO  |                |
| 1        | 1     | 1.0    | 6    |     | P07TYA | NAME   | DEF NO NO  |                |
| 1        | 1     | NEXT   | 6    |     | P07TYA |        | DEF NO NO  |                |
| 1        | 1     | NEXT   | 6    |     | P07TYA | CITZIP | DEF YES NO |                |

Press **ENTER**.

- Step 16.** Enter **E** in the 'OPT' column on line 2 to edit the field format NAME. Press **ENTER**.

- Step 17.** Repeat the line displayed on the panel twice and make these entries on the Edit a Field Format panel:

| Unit Measure: IN |       |         |         |       |        |      |       |          |  |
|------------------|-------|---------|---------|-------|--------|------|-------|----------|--|
| LPI: 6           |       |         |         |       |        |      |       |          |  |
| INPUT            |       | OUTPUT  |         | PRINT |        |      |       |          |  |
| OPTION           | START | LENGTH  | ACROSS  | DOWN  | DIR    | FONT | COLOR | CONSTANT |  |
| 1                | 25    | CURRENT | CURRENT | A     |        | DEF  | NO    |          |  |
| 1                | 25    | 0.37    | 0.8     | A     | UN110E | DEF  | NO    |          |  |
|                  |       | CURRENT | 0.8     | A     | UN110E | DEF  | YES   |          |  |

Press **ENTER**.

- Step 18.** Enter **E** on line 3, then press **ENTER**.

- Step 19.** Make these entries on the Edit a Constant String panel:

Field Format: NAME  
 Type (C/X): C  
 Delimiter: @  
 String: ,

Press **ENTER**, then press **PF3** twice.

- Step 20.** Enter **E** in the 'OPT' column on line 4 to update the field format CITZIP. Press **ENTER**.

**Step 21.** Make these entries on the Edit a Field Format panel:

---

---

Unit Measure: **IN**

LPI: **6**

|        | INPUT | OUTPUT  | PRINT   |      |       |      |       |          |
|--------|-------|---------|---------|------|-------|------|-------|----------|
| OPTION | START | LENGTH  | ACROSS  | DOWN | DIR   | FONT | COLOR | CONSTANT |
| _ 1__  | 30__  | CURRENT | CURRENT | A    | _____ | DEF  | NO_   |          |

---

---

Press **ENTER**, then press **PF3**.

**Step 22.** Enter **C** in the 'OPT' column on line 4 to define conditional processing parameters. Press **ENTER**.

**Step 23.** On the Edit Conditional Formatting Parameters selection panel, enter **E** in the 'OPTION' column and **LETTER** in the 'CONDITION ID' column. Press **ENTER**.

**Step 24.** Repeat the line displayed on the panel once and make these entries on the Edit Conditional Formatting Parameters panel:

---

---

Start Position: **18**

Length: **3**

| OPTION | TYPE | B/A | L/G  | COPY  | MODIFICATION | NAME  | PAGE | LAYOUT | NAME |
|--------|------|-----|------|-------|--------------|-------|------|--------|------|
| _ EQ   | B    | G   | LTR2 | _____ | NULL         | _____ |      |        |      |
| _ EQ   | B    | G   | LTR1 | _____ | NULL         | _____ |      |        |      |

---

---

Press **ENTER**. Then enter **E** in the 'OPTION' column to define comparison text for the first comparison.

**Step 25.** Make this entry on the Edit Comparison Text panel:

---

---

OPT COMPARISON TEXT

\_ 331\_\_\_\_\_

---

---

Press **ENTER**, then press **PF3**.

Enter **E** in the 'OPTION' column to define comparison text for the second comparison.

**Step 26.** Make this entry on the Edit Comparison Text panel:

---

---

OPT COMPARISON TEXT

\_ 329 \_\_\_\_\_

---

---

Press **ENTER**. Then press **PF3** until you return to the Maintain Page Formats panel.

**Step 27.** On the Maintain Page Formats panel, enter **2** on the COMMAND line, **LETTER** in the 'Page Format Name' field, and your page format library name in the 'Page Format Library Name' field. Press **ENTER**.

The page format is generated and stored in your page format library. This is the library specified in the XOSF start-up proc DD statement named by the PGFRMDD initialization parameter or the PAGEFORMLIB printer profile parameter. You can now submit a job using this page format by specifying PAGEFORM=LETTER in your extended JCL.

# *Section Nine: Appendices*

This section contains the appendices to the XPAF documentation.

Appendix A provides instructions on using the LDMUTIL utility to define and initialize your native resource libraries.

Appendix B provides sample JCL to use for uploading resources from a file to a the host system.

Appendix C identifies the initialization and printer profile parameters related to managing resources.

## A. *Defining and initializing native libraries*

You can use the library data management utility (LDMUTIL) to initialize and maintain native libraries. LDMUTIL is a batch utility that provides these functions:

- Initialize a native library
- Offload data from a native library
- Reload data that has been offloaded
- Verify the space bitmap in a library
- List directory entries or library statistics
- Expand the size of a native library

Because of the nature of these functions, some of them cannot be performed through XOAF.

### *Executing an LDMUTIL function*

---

LDMUTIL reads a parameter card, which specifies the name of the function being executed and the name of the dataset against which the function is to be performed. You can specify multiple parameter cards for one execution of LDMUTIL.

### *Parameter card conventions*

---

The parameter card is free-form, with these restrictions:

- No continuations are permitted.
- Both the function and dataset name must be included in the same card.

A function name can be coded in full or truncated to as few characters as required to identify it uniquely. For example, any of these options invokes the offload function:

O  
OF  
OFF  
OFFL  
OFFLO  
OFFLOA  
OFFLOAD

## Required DD statements

---

Include these DD statements in your JCL:

| Statement       | Function                                                                                                                                                                                                                                      |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LDMPARM</b>  | Indicates LDMUTIL commands which can be stored in a dataset or included instream.                                                                                                                                                             |
| <b>LDMPRINT</b> | Indicates where LDMUTIL should log any messages produced during execution. This entry may specify SYSOUT or the name of a message dataset. If a dataset, it must have these file specifications:<br><br>LRECL=133<br>RECFM=FA<br>BLKSIZE=1330 |
| <b>SYSUT1</b>   | Names the input dataset for the reload function only.                                                                                                                                                                                         |
| <b>SYSUT2</b>   | Names the output dataset for the offload function only. The maximum record length in a native library is 64K. File size definitions are not required because XOSF allocates the file automatically when you submit the job.                   |

## Offload and reload options

---

With both the offload and reload functions, you can use the INCLUDE, EXCLUDE, and wildcard options to make these functions more efficient. The function of each option is described below.

When using the options, follow these conventions:

- Use of the keywords INCLUDE or EXCLUDE is optional, the default is INCLUDE.
- The input card is free-form. You can enter the option and member name(s) in any order.
- You cannot specify the INCLUDE and EXCLUDE options on the same input card.
- The options cannot be abbreviated. For example, you can enter INCLUDE, but not INC.
- The dataset name, option, and member name(s) must be separated by commas.

### *INCLUDE option*

---

Specify INCLUDE to offload or reload specific members from a library. For example, you could use any of these input cards to offload only the AAC129 member:

```
OFFLOAD prefix.library-name,AAC129,INCLUDE
OFFLOAD prefix.library-name,INCLUDE,AAC129
OFFLOAD prefix.library-name,AAC129
```

This example offloads the AAC129 and AAC130 members:

```
OFFLOAD prefix.library-name,INCLUDE,AAC129,AAC130
```

Including all members is the default and does not need to be specified. For example, you could use this input card to offload all the members from the native library named *prefix.TABLELIB*:

```
OFFLOAD prefix.TABLELIB
```

### *EXCLUDE option*

---

Specify EXCLUDE to offload or reload all the members in a library except the ones identified in the command. For example, you could use either of these input cards to reload to *prefix.library-name* all the members except AAC129 and AAC130:

```
RELOAD prefix.library-name,AAC129,AAC130,EXCLUDE
RELOAD prefix.library-name,EXCLUDE,AAC129,AAC130
```

### *Wildcard option*

---

Use an asterisk ( \* ) as a wildcard to select member names with a particular prefix. For example, you could use this input card to offload all the members with FONT as the first four characters of their names:

```
OFFLOAD prefix.library-name,INCLUDE,FONT*
```

## *Abends*

---

If any function gives a non-zero return code, LDMUTIL abends with a user abend.

An error message indicating why the abend occurred may be included in the job listing.

## Initializing a native library

---

The initialize function prepares a native library for use. It defines a new native library, builds the header record, and initializes each library block in the library as empty. Before you can initialize a native library, you must allocate it using the IBM IDCAMS utility.

Example:

```
//job-name JOB job-information
//LDMINIT EXEC PGM=LDMUTIL,REGION=2048K
//STEPLIB DD DSN=prefix.XPFLOAD,DISP=SHR
//SYSPRINT DD SYSOUT=class
//LDMPRINT DD SYSOUT=class
//LDMPARM DD *
INITIALIZE prefix.library-name
```

**NOTE:** When you use this function, z/OS issues message IEC070I for each dataset initialized. This is not an error; the message simply indicates that initialization is complete.

---

## Offloading data from a native library

---

The offload function copies data from a native library to a sequential dataset defined by SYSUT2. You can use the INCLUDE, EXCLUDE, and wildcard options.

Example:

```
//job-name JOB job-information
//OFFLOAD EXEC PGM=LDMUTIL,REGION=2048K
//STEPLIB DD DSN=prefix.XPFLOAD,DISP=SHR
//SYSUT2 DD DSN=output-dataset-name,
// DISP=(NEW,CATLG),UNIT=storage-unit,
// SPACE=(TRK,(45,45)),VOL=SER=volser
//SYSPRINT DD SYSOUT=class
//LDMPRINT DD SYSOUT=class
//LDMPARM DD *
OFFLOAD prefix.TABLIB1,INCLUDE,AAC129,AAC130
//
```

**CAUTION:** To enter more than one OFFLOAD statement per job execution, you must include DISP=MOD on the SYSUT2 statement. If you specify two or more OFFLOAD statements and do not specify DISP=MOD, the library from the last OFFLOAD statement will overwrite the previous offloads.

## Reloading data that has been offloaded

The reload function reloads members that have been offloaded by the offload function.

**CAUTION:** You can only reload a member that was offloaded via XOSF. If you performed the offload via XOAF, you must use XOAF to reload the member.

You can use the INCLUDE, EXCLUDE, and wildcard options. Enter multiple input cards as needed to include a number of individual members.

Example:

```
//job-name JOB job-information
//RELOAD EXEC PGM=LDMUTIL,REGION=2048K
//STEPLIB DD DSN=prefix.XPFLOAD,DISP=SHR
//SYSUT1 DD DSN=input-library-name,DISP=SHR,
// DCB=(BLKSIZE=32000,LRECL=X,RECFM=VBS)
//SYSPRINT DD SYSOUT=class
//LDMPRINT DD SYSOUT=class
//LDMPARM DD *
RELOAD prefix.TABLIB1,INCLUDE,AAC129,AAC130,AAC131
RELOAD prefix.TABLIB1,INCLUDE,AAC136,AAC138
```

## Verifying the space bitmap in a library

---

The verify function follows the block chain pointers in the library blocks allocated to a library member, and marks the blocks as allocated in the space map. This function does not check for corrupted chains or verify that the dataset content is correct.

Example:

```
//job-name JOB job-information
//VERIFY EXEC PGM=LDMUTIL,REGION=2048K
//STEPLIB DD DSN=prefix.XPFLOAD,DISP=SHR
//SYSPRINT DD SYSOUT=class
//LDMPRINT DD SYSOUT=class
//LDMPARM DD *
VERIFY prefix.library-name
```

## Listing directory entries

The directory function prepares a list of the directory entries in a library. The listing shows this information:

- Member name
- Date and time of creation
- Date and time of last update
- Number of records
- Length of the user portion of the directory entry
- Up to eight bytes of data from the user portion of the directory entry

Example:

```
//job-name JOB job-information
//LDMUTIL EXEC PGM=LDMUTIL,REGION=2048K
//STEPLIB DD DSN=prefix.XPFLOAD,DISP=SHR
//SYSPRINT DD SYSOUT=class
//LDMPRINT DD SYSOUT=class
//LDMPARM DD *
DIRECTORY prefix.library-name
```

The directory listing that is created looks similar to this:

| MEMBER NAME | CREATE<br>DATE | CREATE<br>TIME | UPDATE<br>DATE | UPDATE<br>TIME | NUMBER OF<br>RECORDS | USER<br>LENGTH | 8 BYTES OF<br>DATA IN HEX |
|-------------|----------------|----------------|----------------|----------------|----------------------|----------------|---------------------------|
| FONTFF0     | 8/22/95        | 12:34:56       | 11/05/95       | 6:20:08        | 5                    | 0              |                           |
| FONTFF1     | 8/22/95        | 12:35:01       | 11/25/95       | 2:02:00        | 5                    | 0              |                           |
| FORMFF0     | 1/01/95        | 11:40:50       | 1/25/95        | 9:15:21        | 1                    | 0              |                           |
| FORMFF1     | 1/01/95        | 11:40:51       | 1/25/95        | 9:15:22        | 1                    | 0              |                           |
| FORMFF5     | 1/01/95        | 11:40:52       | 1/25/95        | 9:15:23        | 1                    | 0              |                           |
| IMAGFF0     | 4/01/95        | 12:34:56       | 4/17/95        | 10:00:44       | 178                  | 0              |                           |

## Listing library statistics

---

The statistics function prepares a list of statistics for a native library. The listing shows this information:

- Date and time the directory was created
- Number of active members
- Blocks available
- Blocks used
- Blocks allocated

Example:

```
//job-name JOB job-information
//LDMUTIL EXEC PGM=LDMUTIL,REGION=2048K
//STEPLIB DD DSN=prefix.XPFLOAD,DISP=SHR
//SYSPRINT DD SYSOUT=class
//LDMPRINT DD SYSOUT=class
//LDMPARM DD *
STATISTICS prefix.library-name
```

The library statistics listing that is created looks similar to this:

```
LIBRARY STATISTICS FOR prefix.library-name
DATE OF CREATION : 95/198
TIME OF CREATION : 12:34:00
NUMBER OF ACTIVE MEMBERS : 150
NUMBER OF BLOCKS AVAILABLE : 0
NUMBER OF BLOCKS USED : 896
NUMBER OF BLOCKS ALLOCATED : 896
```

## Expanding the size of a native library

---

Occasionally, XPAF issues a message letting you know that a native library has become full. You also can find out if a library is full by using the LDMUTIL statistics function. When this happens, you should expand the size of the library.

XPAF manages the VSAM cluster as its own library, complete with space map and directory pointers. If you use IDCAMS REPRO to offload this library and DELETE/DEFINE followed by a REPRO to restore the cluster, you will not increase the size of the native library.

**NOTE:** You may want to use IDCAMS to perform a backup of the native library before you increase its size.

---

Perform these steps to expand the full library:

- Step 1.** Create a VBS record dataset, then offload the native library to the dataset. Refer to “Offloading data from a native library” earlier in this chapter for sample JCL to use.
- Step 2.** Using IDCAMS, DELETE and DEFINE a new native library with an increased cluster size. To determine the IDCAMS DEFINE specifications, view the JCL for the resource installation job RJOB101 used for installing XPAF.
- Step 3.** Initialize and reload the expanded cluster from the offload dataset. Refer to “Initializing a native library” and “Reloading data that has been offloaded” earlier in this chapter for sample JCL to use.

LDMEXPND: This is a sample JCL showing the procedure to expand the size of the XPAF VSAM library and should be used when the XPAF VSAM library becomes full and requires more space.

**NOTE:** Member LDMEXPND in XPFSAMP contains an example of how to expand a VSAM library.

---

## B. Uploading resources from file to host

You can use this sample JCL to copy the members from a file into a library on the host. Be sure to make the necessary changes for your site's requirements.

Before you submit this JCL, make sure that a library has been allocated and initialized. For instructions, refer to appendix A, [“Defining and initializing native libraries.”](#)

### Sample JCL

```
//job-name JOB job-information
/* YOU MUST CHANGE THE FOLLOWING:
/* * 1. nnnnnnn - EXTERNAL NAME ON THE INPUT file AND
/* * file VOL=SER
/* * 2. member-name - PDS MEMBER NAME INTO WHICH file
/* * MEMBER IS LOADED
/* * 3. DCB INFORMATION FOR SYSUT1:
/* * JDL - F,80,80
/* * FONTS, FORMS, IMAGES - FB,128,512
/* * 4. DCB INFORMATION FOR SYSUT2:
/* * JDL - F,80,MULTIPLE OF 80
/* * FONTS, FORMS, IMAGES - FB,128,512
/* * 5. SPACE - ADJUST FOR RESOURCES BEING OFFLOADED
/* * 6. volser - VOLUME SERIAL NUMBER FOR OUTPUT PDS
//DELETE EXEC PGM=IEFBRL4
//DD1 DD DSN=dataset-name,
// DISP=(MOD,DELETE,DELETE),
// UNIT=3380,SPACE=(TRK,(0,0))
//UPLOAD EXEC PGM=IEBGENER
//SYSPRINT DD SYSOUT=*
//SYSUT1 DD UNIT=file,DSN=nnnnnn,
// DCB=(RECFM=X,LRECL=XX,BLKSIZE=XXX),
// LABEL=(1,BLP),DISP=(OLD,PASS),VOL=SER=nnnnnn
//SYSUT2 DD DSN=dataset-name(member-name),
// DISP=(NEW,CATLG,DELETE),
// DCB=(RECFM=XX,LRECL=XX,BLKSIZE=XXX),
// SPACE=(TRK,(10,1,5)),UNIT=3380,VOL=SER=volser
//SYSIN DD DUMMY
```

## C. *Resource management parameters*

During installation, your systems programmer specifies values for initialization and printer profile parameters. Initialization parameters and their values are stored in members XINSXOAF and XINSXOSF of XINPARM. The printer profile for each XPAF printer is stored in the library referenced by the PROFDD initialization parameter in XINSXOSF.

This appendix contains a table for each of these resource types:

- Fonts
- Forms
- Images
- Logos
- Resource lists
- PDL
- Page formats
- Paper-related tables
- Color cross-reference and color conversion tables

Each table identifies the parameters whose values you will need to know before you can manage that resource type. Use these tables to record your site's value for each parameter.

## Parameters related to font resource management

| Parameter | Type                               | Function                                                                                                                               | Default                                                                                                                                                                                                          | Your site's value |
|-----------|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| AUTOREV   | Initialization and printer profile | Specifies whether to download fonts automatically from the Xerox native font library that are newer than the same font on the printer. | <ul style="list-style-type: none"> <li>At initialization level: NONE</li> <li>At printer profile level: AUTOREV initialization parameter value</li> </ul>                                                        |                   |
| CFONTLIB  | Initialization                     | Identifies the DD statement that specifies the system-wide centralized font library                                                    | CFONTLIB                                                                                                                                                                                                         |                   |
| DELFONT   | Printer profile                    | Indicates whether to delete downloaded fonts from the centralized printer after the document has been printed                          | NO                                                                                                                                                                                                               |                   |
| DFONTLIB  | Initialization                     | Identifies the DD statement that specifies the system-wide decentralized font library                                                  | DFONTLIB                                                                                                                                                                                                         |                   |
| FNTTBLDD  | Initialization                     | Identifies the DD statement that specifies the native library containing the XPAF font tables                                          | TABLELIB                                                                                                                                                                                                         |                   |
| FONTLIB   | Printer profile                    | Identifies the DD statement that specifies the primary native font library for a printer                                               | <ul style="list-style-type: none"> <li>For centralized printers: CFONTLIB initialization parameter value</li> <li>For decentralized and PCL-capable printers: DFONTLIB initialization parameter value</li> </ul> |                   |
| IBMFONTDD | Initialization                     | Identifies the DD statement that specifies the IBM font library for AFP processing                                                     | IBMFONT                                                                                                                                                                                                          |                   |

| Parameter | Type                               | Function                                                                                                                                 | Default                                                                                                                                                        | Your site's value |
|-----------|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| PFONTLIB  | Initialization and printer profile | Identifies the DD statement that specifies the library in which fonts that have been converted dynamically to PCL format will be stored. | <ul style="list-style-type: none"> <li>At initialization level: PFONTLIB</li> <li>At printer profile level: PFONTLIB initialization parameter value</li> </ul> |                   |
| SFONTLIB  | Printer profile                    | Identifies the DD statement that specifies the secondary (centralized) font library to be searched to obtain font metric information     | CFONTLIB initialization parameter value                                                                                                                        |                   |

## Parameters related to form resource management

| Parameter | Type                               | Function                                                                                                                                                                                                                                                                                                                                                           | Default                                                                                                                                                                                                          | Your site's value |
|-----------|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| AUTOREV   | Initialization and printer profile | <p>For non-AFP resources, indicates whether to force a resource download if the most current resource is in the XPAF native resource library and not on the printer.</p> <p>For AFP resources, indicates whether to force a resource conversion and download if the most current resource is in the AFP resource library and not in the XPAF resource library.</p> | <ul style="list-style-type: none"> <li>At initialization level: NONE</li> <li>At printer profile level: AUTOREV initialization parameter value</li> </ul>                                                        |                   |
| CFORMLIB  | Initialization                     | Identifies the DD statement that specifies the system-wide centralized form library                                                                                                                                                                                                                                                                                | CFORMLIB                                                                                                                                                                                                         |                   |
| DELFORM   | Printer profile                    | Indicates whether to delete downloaded forms from the centralized printer after the document has been printed                                                                                                                                                                                                                                                      | NO                                                                                                                                                                                                               |                   |
| DFORMLIB  | Initialization                     | Identifies the DD statement that specifies the system-wide decentralized form library                                                                                                                                                                                                                                                                              | DFORMLIB                                                                                                                                                                                                         |                   |
| FORMLIB   | Printer profile                    | Identifies the DD statement that specifies the primary native form library for a printer                                                                                                                                                                                                                                                                           | <ul style="list-style-type: none"> <li>For centralized printers: CFORMLIB initialization parameter value</li> <li>For decentralized and PCL-capable printers: DFORMLIB initialization parameter value</li> </ul> |                   |

| PAGESEGDD | Initialization                     | Identifies the DD statement that specifies the page segment library for AFP processing                                                                                          | PSEGLIB                                                                                                                                                        |                   |
| PIMAGELIB | Initialization and printer profile | Identifies the DD statement that specifies the library in which images that have been converted dynamically to PCL format will be stored                                        | <ul style="list-style-type: none"> <li>At initialization level: PIMGLIB</li> <li>At printer profile level: PIMAGELIB initialization parameter value</li> </ul> |                   |
| PRINTENV  | Initialization                     | Determines how XPAF dynamically converts AFP images colorized via the IID structured field for printing on a centralized printer                                                | MONO                                                                                                                                                           |                   |
| SIMAGELIB | Printer profile                    | Identifies the DD statement that specifies the secondary (centralized) image library to be searched if a decentralized image cannot be found in the decentralized image library | CIMAGELIB initialization parameter value                                                                                                                       |                   |

## Parameters related to logo resource management

| Parameter | Type                               | Function                                                                                                                               | Default                                                                                                                                                   | Your site's value |
|-----------|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| AUTOREV   | Initialization and printer profile | Specifies whether to download logos automatically from the Xerox native logo library that are newer than the same logo on the printer. | <ul style="list-style-type: none"> <li>At initialization level: NONE</li> <li>At printer profile level: AUTOREV initialization parameter value</li> </ul> |                   |
| CLOGOLIB  | Initialization                     | Identifies the DD statement that specifies the system-wide native logo library                                                         | CLOGOLIB                                                                                                                                                  |                   |
| DELLOGO   | Printer profile                    | Indicates whether to delete downloaded images from the centralized printer after the document has been printed                         | NO                                                                                                                                                        |                   |
| LOGOLIB   | Printer profile                    | Identifies the DD statement that specifies the native logo library for a printer                                                       | CLOGOLIB initialization parameter value                                                                                                                   |                   |

## Parameters related to list resource management

| Parameter | Type            | Function                                                                                                                  | Default                      | Your site's value |
|-----------|-----------------|---------------------------------------------------------------------------------------------------------------------------|------------------------------|-------------------|
| FEATURE   | Printer profile | Identifies whether the printer can store downloaded resources through the FILEKEEP/ NOFILEKEEP setting                    | Depends on the printer model |                   |
| FONTLIST  | Printer profile | Identifies the resident font list for the printer                                                                         | None                         |                   |
| FORMLIST  | Printer profile | Identifies the resident form list for the printer                                                                         | None                         |                   |
| IMAGELIST | Printer profile | Identifies the resident image list for the printer                                                                        | None                         |                   |
| LIBRARY   | Printer profile | Identifies the DD statement that specifies the native library for resident font, form, image and logo lists for a printer | None                         |                   |
| LOGOLIST  | Printer profile | Identifies the resident logo list for the printer                                                                         | None                         |                   |
| XNS       | Printer profile | Identifies whether the printer can support two-way communication with XPAF                                                | Depends on the printer type  |                   |

## Parameters related to PDL resource management

---

| Parameter | Type                               | Function                                                                                          | Default                                                                                                                                                    | Your site's value |
|-----------|------------------------------------|---------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| PDLLIB    | Initialization and printer profile | Identifies the DD statement that specifies the native library used when processing DJDE documents | <ul style="list-style-type: none"> <li>At initialization level: PDLLIB</li> <li>At printer profile level: PDLLIB initialization parameter value</li> </ul> |                   |

## Parameters related to page format resource management

---

| Parameter   | Type            | Function                                                                       | Default                                | Your site's value |
|-------------|-----------------|--------------------------------------------------------------------------------|----------------------------------------|-------------------|
| PAGEFORMLIB | Printer profile | Identifies the DD statement that specifies the dataset containing page formats | PGFRMDD initialization parameter value |                   |
| PGFRMDD     | Initialization  | Identifies the DD statement that specifies the dataset containing page formats | PAGEFORM                               |                   |

## Parameters related to paper-related tables

| Parameter | Type                               | Function                                                                                                                                          | Default                                                                                                                                                        | Your site's value |
|-----------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| CLUSTRTB  | Printer profile                    | Identifies the cluster mapping table used to map a centralized paper tray cluster name to a paper tray on a decentralized or PCL-capable printer  | DEFAULTxxxx, where xxxx is the printer model. For NPS printers, DEFAULTDPNP.                                                                                   |                   |
| PAPERSIZ  | Initialization and printer profile | Specifies the default paper size                                                                                                                  | <ul style="list-style-type: none"> <li>At initialization level: LETTER</li> <li>At printer profile level: PAPERSIZ initialization parameter value</li> </ul>   |                   |
| PAPNAMTB  | Initialization and printer profile | Identifies the paper name table used to determine the physical page size dimensions that correlate to a specified paper name                      | <ul style="list-style-type: none"> <li>At initialization level: DEFAULT</li> <li>At printer profile level: PAPNAMTB initialization parameter value</li> </ul>  |                   |
| PAPTBLDD  | Initialization and printer profile | Identifies the DD statement that specifies the library where the paper-related tables are stored                                                  | <ul style="list-style-type: none"> <li>At initialization level: TABLELIB</li> <li>At printer profile level: PAPTBLDD initialization parameter value</li> </ul> |                   |
| VARPAPT   | Initialization and printer profile | Identifies the varying paper size tables used to determine the physical paper size that corresponds to the AFP bin number for the current printer | None                                                                                                                                                           |                   |

## Parameters related to color cross-reference tables and color conversion table

| Parameter | Type                               | Function                                                                                                                                    | Default                                                                                                                                                       | Your site's value |
|-----------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| INKXLIB   | Initialization and printer profile | Identifies the DD statement that specifies the native library that contains the color cross-reference tables and the color conversion table | <ul style="list-style-type: none"> <li>At initialization level: TABLELIB</li> <li>At printer profile level: INKXLIB initialization parameter value</li> </ul> |                   |
| INKXREF   | Initialization and printer profile | Identifies the default color cross-reference table                                                                                          | <ul style="list-style-type: none"> <li>At initialization level: None</li> <li>At printer profile level: INKXREF initialization parameter value</li> </ul>     |                   |

# *Section Ten: Glossary*

This section contains a list of glossary terms and abbreviations found in the XPAF documentation.

# Glossary

## Numerics

---

**2700 font format** — A standard font format that is used for Xerox decentralized fonts.

**4-word FST font format** — A standard font format that is used for Xerox centralized fonts. This format is based on the 4-word File Specification Table.

## A

---

**ABIC** — Algorithm Bilevel Q-Coder

**ACB** — Access Control Block

**Advanced Function Printing (AFP)** — An IBM family of software products that enables you to place text and images at any point on a page.

**AEG** — Active Environment Group

**AFP** — See *Advanced Function Printing*.

**AFP bin number** — The medium source drawer value as specified in the MMC structured field of the form definition.

**AFW** — ASCII fonts width

**all-points addressability (APA)** — The ability to print text and images at any point on the page within the resolution of the printer (for example, 300 dots per inch) and the printable area of the page.

**American Standard Code for Information Interchange (ASCII)** — A code for representing alphanumeric information. ASCII values are used in conjunction with character identifiers in XPAF centralized and decentralized character mapping tables. XPAF uses two hexadecimal digits to represent the location of the character in the centralized or decentralized font.

**ANSI** — American National Standards Institute

**APA** — See *all-points addressability*.

**APAR** — See *Authorized Program Analysis Report*.

**APDL** — Active Printer Device List

**APF** — Authorized Program Facility

**API** — Application programming interface

**Application programming interface** — The interface by which an application program accesses the operating system and other services.

**Application socket** — See *Direct socket*.

**ASA** — American Standards Association

**ASCII** — See *American Standard Code for Information Interchange*.

**ASCII font widths table (XPAFAFW)** — An XPAF font table that contains the widths of each physical character for a replica font. It is used to correct the positioning of characters when converting character placements from 240 to 300 dpi.

**ASCII-to-ASCII table (XPAFA2A)** — An XPAF font table that links the character mapping of the centralized version of the font to the character mapping of the decentralized version of the font. This table is used when printing centralized (DJDE) documents on decentralized printers to determine where a character is mapped within the decentralized version of the font being used.

**Authorized Program Analysis Report (APAR)** — A field-test ready patch or module replacement which resolves a specific customer problem.

## B

---

**backspacing** — A capability whereby the console operator initiates backspacing using standard JES2 or JES3 printer commands. For line-mode, DJDE, XES, page-formatted, and AFP documents sent to centralized, decentralized, and PCL-capable printers, the printer backspaces to a specified page number from the current point of printing.

**banner page** — A page issued with a print job that contains certain job information, including but not limited to, the user ID, job ID, and print date. The banner page can be issued as a header page before each print job, as a trailer page after each print job, or as a separator page between each dataset. Also known as a separator page.

**BASE300** — IBM AFP 300 dpi resolution raster fonts supplied as newly developed raster patterns.

**baseline** — An imaginary line on which the base of each successive character is placed.

**bin number** — The medium source drawer value as specified in the MMC structured field of the form definition.

**bitmapped format fonts** — A font for which each character is made up of a raster pattern.

**BLDL** — build list

**BLKSIZE** — block size

**BOF** — bottom of form

**BPAM** — Basic Partitioned Access Method

## C

**cataloged member** — Cataloged member files and JSL files are the two file formats that are valid for PDL. CMEs and PDEs are the two most common types of cataloged members. See *copy modification entry* and *page description entry*.

**CCITT** — Consultive Committee for International Telegraph and Telephone

**CCMV** — Centralized character mapping table. See *character mapping table*.

**CCW** — channel command word

**centralized printer** — A high-volume printer that is generally channel-attached, but sometimes is remotely-attached to the host. These printers are used to print LCDS data streams. Centralized printers include these models: 9790, 9700, 8790, 8700, DocuPrint 4890 LPS, DocuPrint 4850 LPS, DocuPrint 4650 LPS, DocuPrint 4635 LPS, DocuPrint 4635MX LPS, DocuPrint 4235 LPS (XPPM mode), DocuPrint 4135 LPS, DocuPrint 4090 LPS, DocuPrint 4050 LPS, DocuPrint 180 EPS, DocuPrint 180 LPS, DocuPrint 96 LPS, and DocuPrint 92C LPS.

**CFC** — constant forms control

**CFI** — The coded font index structured field within an IBM coded font.

**channel-attached** — The direct attachment of devices by input/output channels to a host computer.

**character identifier (CHARID)** — A unique eight-character name that identifies a single character.

**character mapping table** — An XPAF font table that contains mapping information for fonts within a font mapping variation. The table relates a character identifier to a location within a font, usually in ASCII or EBCDIC representation.

**character set** — A set of character identifiers and their related raster patterns that make up an IBM font.

**CHARID** — See *character identifier*.

**checkpoint restart** — A capability whereby checks are taken at predefined intervals (for example, every 100 pages, or every 2 minutes) during transmission of a data stream. In the event of a system crash or a transmission failure, data transmission is resumed from the point at which the last check was taken.

**CISZ** — control interval size

**CLPA** — Clear Link Pack Area

**cluster mapping table** — An XPAF table, modifiable through XOAF, that maps a centralized paper tray cluster name to a paper tray on a decentralized or PCL-capable printer.

**CM** — Communications Module

**CMD** — command

**CME** — See *copy modification entry*.

**code page** — An IBM translate table that maps an EBCDIC code point to a character identifier.

**code page global identifier** — A unique code page identifier that is specified within the global resource identifier (GRID) value found in an MCF-2 structured field.

**code page global identifier table (CPGID)** — An XPAF font table that contains the graphic character set global identifier and code page global identifier values for every IBM code page member found in your IBM font library when an XPAF IBM font table update option is run. XPAF uses this table when processing an MCF-2 structured field GRID value to determine the character set and code page for the font being processed.

**code point** — The location of a specific character within a font, usually represented as a 2-digit hexadecimal ASCII or EBCDIC value.

**coded font** — A character set/code page pair.

**coded font name table (XPAFCFN)** — An XPAF font table that links an IBM coded font with a code page and character set.

**color conversion table** — The table that contains the ink color-to-RGB value translations for the 4700 printer. Whenever changes are made to this table, it must be reloaded using either the XOAF Maintain the Color Conversion Table option on the Manage Tables menu or the LOAD INKS TSO/batch command.

**color cross-reference table** — A table that defines ink color substitutions for a document to a 4850 or 4890 printer. Use the XOAF Maintain Color Cross-Reference Tables option on the Manage Tables menu to create, update, or delete color cross-reference tables.

**color image** — An image that includes one or more colors, except black.

**composed text** — Data that has been formatted into discrete pages for printing.

**connection** — A communication path between XPAF and a server.

**conversation** — An exchange of information between XPAF and a server. A job transmission from XPAF to a server is an example of a conversation.

**copy modification (COPYMOD)** — A set of parameters contained in a page format that defines how formatting changes from one set of copies to the next.

**copy modification entry (CME)** — A set of statements that modify the output printing characteristics of a report on a copy-to-copy basis. A CME can be a cataloged member, which is one of the valid formats for PDL.

**COPYMOD** — See *copy modification*.

**CPC** — The Code Page Control structured field within an IBM code page.

**CPGID** — See *code page global identifier table*.

**CPI** — The code page index structured field within an IBM code page.

**CPU** — central processing unit

**CSA** — Common Storage Area

**CSI** — Consolidated Software Inventory

**CSN** — character set name

**cut sheet** — The use of single, unconnected sheets of paper or other printing media in laser printers.

## D

---

**DASD** — Direct Access Storage Device

**DCB** — Data Control Block

**DCF** — See *Document Composition Facility*.

**DCMV** — Decentralized character mapping table. See *character mapping table*.

**DD** — Data Definition

**DDI** — Dynamic Document Interface

**DDN** — Data Definition Name

**DDNAME** — Data Definition Name

**decentralized printer** — A low-volume printer that is generally remotely-attached to the host. These printers are used to print XES data streams. Decentralized printers include these models: 4700 II, 4213 II, 4197 MICR, 4045, 4030 II, 3700, and DocuPrint 4235 LPS.

**DEG** — Document Environment Group

**desixelize** — The process of converting a resource from sixelized format to a raster bit pattern.

**DFA** — See *Document Finishing Architecture*.

**DFP** — Data Facility Product

**Direct connect** — See *Direct socket*.

**Direct LPR** — A communication link using the LPR/LPD protocol to send data to an LPD server.

**Direct socket** — A direct communication link to an IP address.

**distribution keyword** — The IBM JCL keywords ADDRESS, BUILDING, DEPT, NAME, ROOM, and TITLE used for banner pages.

**DJDE** — See *dynamic job descriptor entry*.

**Document Composition Facility (DCF)** — An IBM software product that provides text formatting capabilities using SCRIPT/VS and the Generalized Markup Language (GML).

**Document Finishing Architecture (DFA)** — An interface that is available on some centralized printers. This interface enables the centralized printer to send a signal to third-party finishing equipment to begin a specific operation (for example, perforate) with the current sheet entering the finisher and continue until the signal is removed.

**document switch processing** — The process by which a printer switches from one document processing mode (for example, XES) to another, such as PCL. This processing is activated by the mode change key (MCK) command within a data stream.

**dots per inch** — The resolution of a resource or a page.

**dpi** — See *dots per inch*.

**DSC** — data stream compatibility

**DSN** — dataset name

**DSNAME** — dataset name

**DSORG** — dataset organization

**duplex** — A page that contains printing on both sides of the paper.

**dynamic job descriptor entry (DJDE)** — A Xerox control statement within a document that dynamically overrides or changes existing control statements or parameters which specify how a document should be printed on a Xerox printer. These specifications include forms and image merging, font selection, bin switching, report offsetting, and file downloading.

## E

---

**EBCDIC** — See *Extended Binary Coded Decimal Interchange Code*.

**EBCDIC font widths table (XPAFEFW)** — An XPAF font table that contains the Xerox font widths rearranged into EBCDIC format for a given IBM character set.

**EBCDIC-to-ASCII table (XPAFE2A)** — An XPAF font table that translates EBCDIC values for IBM code pages to ASCII values for Xerox and replica fonts.

**EC** — error code

**ECB** — Error Control Block

**EI** — Environmental Intermedium

**electronic printing system (EPS)** — See *laser printing system*.

**endpoint** — See *IP address*.

**EOF** — end of file

**EPS** — See *electronic printing system*.

**Extended Binary Coded Decimal Interchange Code (EBCDIC)** — A code for representing alphanumeric information. EBCDIC values are used in conjunction with character identifiers in Xerox code page tables. XPAF uses two hexadecimal digits to represent the location of the character in the Xerox code page.

# F

---

**FB** — fixed blocked

**FBA** — Fixed Block ANSI

**FBM** — Fixed Block Machine

**FCB** — Forms Control Buffer

**FDL** — See *forms description language*.

**FEP** — Front-end processing

**FGID** — See *font global identifier table*.

**fixed metrics** — The graphic character measurements, in physical units, such as dots or inches.

**FLCA** — Free Library Control Area

**FND** — The font descriptor structured field within an IBM font character set.

**FNI** — The font index structured field within an IBM font character set.

**FNO** — The font orientation structured field within an IBM font character set.

**.FNT** — A file format used for Xerox centralized fonts.

**font** — A set of printing characters that have common characteristics such as style, width, height, and weight.

**font family information table (XPAFFFI)** — An XPAF font table that supports the use of Xerox centralized fonts in IBM DCF.

**font global identifier** — A unique font identifier that is specified within the global resource identifier (GRID) value found in an MCF-2 structured field.

**font global identifier table (FGID)** — An XPAF font table that contains the font global identifier and width of the space character for every IBM character set found in your IBM font library when an XPAF IBM font table update option is run. XPAF uses this table when processing an MCF-2 structured field GRID value to determine the character set for the font being processed.

**font index** — A character string in an input data stream that identifies the font to be used to print a line of data. A font index is used in conjunction with a font list which matches the font index value to a specific font. See *font list*.

**font list** — A list of font names identifying the fonts that are resident on a printer.

Additionally, in a page format, a font list is a list of fonts and their associated font index values. See *font index*.

**form** — An electronically composed arrangement of predefined lines, boxes, text, logos, and embedded text that may be printed as is or merged with data during the printing process. This term is used to indicate either a Xerox centralized resource stored in .FRM file format or a Xerox decentralized resource stored in XES or XPAF-internal file format.

**form definition (FORMDEF)** — An AFP resource that defines the format of the physical page.

**form list** — A list of form names identifying the forms that are resident on a printer.

**FORMDEF** — See *form definition*.

**forms description language (FDL)** — A printer-resident source language used to design electronic forms. See *forms source language* and *.FRM*.

**forms source language (FSL)** — An uncompiled collection of user-created files containing FDL commands. See *forms description language* and *.FRM*.

**forward spacing** — A capability whereby the console operator initiates forward spacing using standard JES2 or JES3 printer commands. For line-mode, DJDE, XES, page-formatted, and AFP documents sent to centralized, decentralized, and PCL-capable printers, the printer forward spaces to a specified page number from the current point of printing.

**.FRM** — A compiled forms source language (FSL) file

**FROM240** — IBM AFP 300 dpi resolution raster fonts converted from an original resolution of 240 dpi.

**FSA** — See *functional subsystem application*.

**FSI** — Functional Subsystem Interface

**FSL** — See *forms source language*.

**FSS** — See *functional subsystem*.

**FST** — Font Specification Table

**functional subsystem (FSS)** — An address space that communicates with JES to drive devices unsupported by JES.

**functional subsystem application (FSA)** — An application running within a functional subsystem.

## G

---

**GDDM** — See *Graphical Data Display Manager*.

**GDG** — generation data group

**GHO** — See *Graphics Handling Option*.

**global resource identifier (GRID)** — An 8-byte external name found in the Fully Qualified Name triplet of an MCF-2 structured field. A global resource identifier is composed of the following values:

- graphic character set global identifier
- code page global identifier
- font global identifier
- width of the space character in 1/1440 inch units

**Global Resource Serialization (GRS)** — An z/OS component that provides resource protection in situations where resources are shared among multiple operating systems.

**GML** — Generalized Markup Language

**graphic** — See *image*.

A vector graphics language for printers.

**graphic character set global identifier** — An identifier that is specified within the global resource identifier (GRID) value found in an MCF-2 structured field.

**Graphical Data Display Manager (GDDM)** — An IBM software product that enables you to create images and convert them into a format that can be integrated with text, data, and forms.

**Graphics Handling Option (GHO)** — A Xerox printer option product that enables a centralized printer to store, merge, and print compressed images.

**Graphics Video Generator (GVG)** — A Xerox printer option that enables you to print 300/600 dpi images in text documents using a 4650 printer.

**GRID** — See *global resource identifier*.

**GRS** — See *Global Resource Serialization*.

**GVG** — See *Graphics Video Generator*.

**GVGII** — Graphics Video Generator II

## H

---

**HCCT** — HASP Communication Control Table

**HCF** — high capacity feeder

**HDC** — See *host distributed communications*.

**Hewlett Packard graphics language (HPGL)** — A vector graphics language for printers.

**HFDL** — See *Host Forms Description Language*.

**highlight color** — The use of solid (spot) color to accentuate or contrast material from monochromatic (usually black) printed areas. The term highlight color is used by Xerox to mean printing with black plus one color.

**HIP** — Host Interface Processor

**HLQ** — high-level qualifier

**host distributed communications (HDC)** — The XPAF client services communications component which provides the LU 6.2 interface.

**Host Forms Description Language (HFDL)** — The Xerox host implementation of forms description language. See *forms description language*.

**HPGL** — See *Hewlett Packard graphics language*.

**HPNS** — High Performance Native Sockets

/

---

**I/O** — input/output

**I/R** — intervention required

**IBM font widths table (XPAFIW)** — An XPAF font table that contains the width of each IBM character in an IBM character set/code page pair. It is used to calculate the intended width of a text string in an AFP document.

**IBM-to-IBM table (XPAFI2I)** — An XPAF font table that contains an entry for every IBM character set distributed with XPAF. This table allows the IBM character sets to be renamed without having to create new IBM-to-Xerox (XPAFI2X) table entries.

**IBM-to-Xerox table (XPAFI2X)** — An XPAF font table that identifies the Xerox fonts needed to replicate the fonts represented by an IBM character set.

**IC** — information code

**ICC** — Image Compression Code

**ICP** — Image Cell Position

**IDCAMS** — A VSAM file utility which reads control statements and performs dataset functions.

**IDM** — Invoke Data Map

**IDR** — see *ink descriptor*.

**IDX** — index

**IID** — See *Input Image Descriptor*.

**IM image** — One of two image object formats used in the AFP data stream. An IM image is device-dependent and uses pel-to-pel mapping for presentation. Contrast with *IO image*.

**image** — A resource that contains visual data such as a picture, map, or graph. For a Xerox resource, this term and *graphic* are used interchangeably to indicate either a centralized resource stored in .IMG file format or a decentralized resource stored in sixelized or .IMG file format. For an IBM resource, this term indicates an image referenced in an AFP data stream.

**image dimension** — The uncompressed size of an image. This size is relative to its origin in terms of positive x and y coordinates. The image dimension is expressed as the number of pels or dots in each direction based on the resolution of the image.

**image list** — A list of image names identifying the images that are resident on a printer.

**Image Object Content Architecture (IOCA)** — IBM's device-independent architecture for processing images. IOCA defines images and image attributes in a manner that can be interpreted uniformly by a variety of devices and software applications.

**image position** — The origin of an image relative to the page or resource origin. The origin is specified in terms of positive x and y coordinates. The image position is expressed as the number of pels or dots in each direction based on the resolution of the image.

**.IMG** — A file format used for Xerox centralized images.

**IMM** — Invoke Medium Map

**initialization parameters** — A set of predefined values that are supplied with XPAF. These values specify XPAF information required by z/OS, JES information required by XPAF, DD statement names, DJDE formats and defaults, and other processing options.

**ink descriptor** — A set of statements that defines the ink catalog, palette, and ink list used for a report. An IDR can be a cataloged member, which is one of the valid formats for PDL.

**ink source language (ISL)** — A printer-based keyword language used to define the multi-level hierarchy of inks that are available on a printer.

**Input Image Descriptor (IID)** — An IBM structured field containing the color code value of an AFP IM-type image object.

**installation service macros (ISM)** — A set of macros that are used to install XPAF, resources, usermods, user exits, and maintenance software.

**installation verification procedure (IVP)** — A series of jobs that are run after product software installation that validate product functionality.

**interface device** — A communication module, interface controller, printer adapter, or protocol converter which allows connectivity between the XPAF host system and remotely-attached printers.

**interleaved** — Refers to the format of a two-color RES .IMG file, whereby each color is represented by alternate bits in the raster data.

**interpress** — A Xerox high level printer command language.

**IO image** — One of two image object formats used in the AFP data stream. An IO image is device-independent and supports image compression on input, scaling, and data parameters for presentation. Contrast with *IM image*.

**IOCA** — See *Image Object Content Architecture*.

**IOCP** — Input/Output Control Program

**IOE** — Input/Output Error

**IP** — Internet Protocol

**IP address** — The host address defined by the Internet Protocol usually represented in dotted decimal notation.

**IP direct** — See *Direct socket*.

**IPDFLT table** — An XPAF font table that contains the default version of the IPSTND table.

**IPL** — Initial Program Load

**IPS** — Include Page Segment

**IPSTND table** — An XPAF font table that defines all the characters for all the IBM fonts which are supported by replica fonts. For each character, this table identifies the character identifier value, plane number, and the ASCII location within the plane.

**IRD** — Image Raster Data

**ISL** — See *ink source language*.

**ISM** — See *installation service macros*.

**ISO6937** — The international standard that specifies graphic characters and control functions, and their coded representations, for use in text communications.

**ISO8859-1** — The mapping format XPAF uses to place characters into centralized and decentralized fonts. Based on ISO8859 standards, it includes some box characters in the unused slots to extend plane 1 functionality.

**ISPF** — Interactive System Productivity Facility

**IVP** — See *installation verification procedure*.

## J

---

**JCL** — Job Control Language

**JDE** — See *job descriptor entry*.

**JDL** — See *job descriptor library*.

**JDT** — JCL Descriptor Table

**JES** — Job Entry Subsystem

**job descriptor entry (JDE)** — A printer-resident command set that groups all the processing parameters for one print job or a group of print jobs which share print characteristics. Several JDEs make up a JDL.

**job descriptor library (JDL)** — An object or compiled file of PDL commands.

**job source library (JSL)** — JSL files and cataloged member files are the two file formats that are valid for PDL. A JSL file begins with a JDL command, includes system, catalog, and job level commands, and ends with an END command.

**job ticket** — A set of commands that specifies the printing, finishing, and job management requirements of a print job. Used by NPS and DocuSP printers.

**JPEG** — Joint Photographic Experts Group

**JSL** — See *job source library*.—

## L

---

**LAN** — Local Area Network

**landscape** — The orientation of print lines or the top of an illustration parallel to the long edge of the paper.

**laser printing system (LPS)** — A printer that uses laser technology to transfer characters and images onto a page. Also known as an electronic printing system (EPS).

**LCA** — Library Control Area

**LCAERRCD** — Library Control Area Error Code

**LCC** — Line Control Code

**LCDS** — laser-conditioned data stream

**LDM** — Library Data Manager (XPAF component)

**LDT** — logical device table

**.LGO** — A file format used for Xerox centralized logos.

**LIB** — see *short-edge-feed MAP*

**library** — Defined areas internal and external to a software product that are used to store resources, files, and programs.

**licensed font** — A font for which you are required to pay royalties to a vendor depending on usage. You can use licensed fonts with XPAF and Xerox printers in accordance with the font licensor's shrink-wrap license agreement or executable license agreement which accompanies all licensed font products.

**CAUTION:** Printing with a licensed font to a non-Xerox printer may violate your licensing agreement.

**line group** — A group of lines on a page that are formatted identically. A line group is sometimes called a subpage.

**line-mode documents** — Documents with no formatting instructions except for carriage control characters.

**LLA** — library lookaside

**logical page** — The area of the physical page on which data can be printed.

**logical unit (LU)** — Also known as LU, a network accessible unit which gives users access to network resources and allows them to communicate with each other.

**logical unit (LU) 6.2** — Also known as LU 6.2, a type of logical unit which is characterized by a peer relationship between session partners. LU 6.2 allows for efficiency in multiple-transaction sessions.

**logical units (L-units)** — Also known as L-units, a unit of linear measurement used by printer data streams. This value is expressed as the inverse of the resolution. In AFP data streams, for example, in a 240 dpi resolution document, one L-unit is equal to 1/240th of an inch; in a 300 dpi resolution document, one L-unit is equal to 1/300th of an inch.

**logo** — A resource that contains an identifying graphical symbol such as a trademarked company or product name. This term is used to indicate a Xerox centralized resource stored in .LGO file format.

**LPA** — Link Pack Area

**LPD** — Line Printer Daemon

**LPI** — lines per inch

**LPR** — Line Printer Requester

**LPS** — See *laser printing system*.

**LRECL** — logical record length

**LSQA** — Local System Queue Area

**LU or LU 6.2** — See *logical unit* (hardware unit).

**L-units** — See *logical units* (software unit).

## M

---

**macro** — A programming instruction that expands into multiple commands. Macros can be interpreted individually, or they can be nested within other macros, each of which can be expanded into individual commands.

**MAS** — Multi Access Spool

**MCC** — Medium Copy Count

**MCF** — Map Coded Font

**MCF-2** — The structured field identifier for IBM's Map Coded Font format 2.

**MCK** — See *mode change key*.

**MCS** — Modification Control Statements

**MDD** — Medium Descriptor

**medium source drawer** — The IBM term for a paper tray.

**Metacode** — A Xerox-generated data stream that provides all-points addressability on centralized printers.

**MICR** — Magnetic Ink Character Recognition

**Mixed Object Document Content Architecture** — An architected device-independent data stream for interchanging documents. **(MO:DCA)**

**MLPA** — Modifiable Link Pack Area

**MMC** — Medium Modification Control

**MO:DCA** — See *Mixed Object Document Content Architecture*.

**mode change key (MCK)** — A code key that indicates whether the printer device supports *document switch processing*.

**monochrome black .IMG** — An image in standard .IMG format that represents only black dots.

**monochrome RES .IMG** — An image in RES format that contains one color (either black or another color).

**MRP** — mid-range printer

**MSF** — Message Service Facility (XPAF component)

**MSFTBLD** — Message Service Facility Table Build

**MSG** — message

**z/OS/ESA** — IBM's System z Operating System/Enterprise Systems Architecture

## N

---

**named fonts** — Printer-resident PCL fonts stored on, and read from, the printer's hard drive.

**national character set** — Characters and symbols that are specific to a national language.

**native library** — A VSAM dataset used by XPAF to store resources.

**native mode** — A data stream submitted through XPAF that already is in a format recognized by Xerox laser printers. XPAF does not have to perform any conversions; however, it will condition the data stream if needed. A DJDE data stream being printed on a centralized printer is a native mode data stream.

**native resource** — The fonts, forms, images, or logos which are in a format recognized by Xerox laser printers. A native resource can be stored either on the printer, stored in a library on the host, or referenced inline in the data stream.

**NCP** — See *Network Control Program*.

**Network Control Program (NCP)** — An IBM licensed program that provides communication controller support for single-domain, multiple-domain, and interconnected network capability.

**network printing system (NPS)** — A network-connected printer that uses laser technology to transfer characters and images onto a page.

**Network Terminal Option (NTO)** — An IBM licensed program that is used in conjunction with NCP to allow certain non-SNA devices to participate in sessions with SNA application programs in the host processor. NTO converts data sent to and from the non-SNA device to the appropriate protocol — SNA or non-SNA.

**NIC** — network interface card

**non-native mode** — A data stream submitted through XPAF that requires conversion to a format the printer can understand. An AFP data stream is a non-native data stream.

**NOP** — No Operation

**NPS** — See *network printing system*.

**NTO** — See *Network Terminal Option*.

**NTRI** — NCP/token ring interconnection

## O

---

**OGL** — See *Overlay Generation Language*.

**orientation** — The direction in which text or images are positioned on the page. When text and images are positioned with the lines parallel to the shorter sides of the paper, the orientation is referred to as portrait. When the lines of text are parallel to the longer sides of the paper, the orientation is called landscape.

**OS/390** — Operating System/390

**OSS** — Operating System Software

**overlay** — An AFP resource that is equivalent to a Xerox form. See *form*.

**Overlay Generation Language (OGL)** — An IBM product which is functionally similar to the Xerox forms description language. OGL is used to create electronic forms in the IBM AFP environment.

## P

---

**page definition (PAGEDEF)** — An AFP resource that specifies formatting of a print dataset into pages of data.

**page description entry (PDE)** — A set of statements that defines formatting (for example, page orientation) for each page of a report. A PDE can be a cataloged member, which is one of the valid formats for PDL.

**page format (PAGEFORM)** — A set of parameters that is used to format line-mode data streams into discrete pages.

**page layout** — A set of parameters contained in a page format that defines the layout of the logical page.

**Page Printer Formatting Aid (PPFA)** — An IBM program designed for creating page definitions and form definitions.

**page segment (PAGESEG)** — This AFP resource represents a portion of a page that may contain composed text and/or images.

**PAGEDEF** — See *page definition*.

**PAGEFORM** — See *page format*.

**PAGESEG** — See *page segment*.

**PAL** — Processor Action List

**palette** — A finite and predetermined set of colors used by color laser printers.

**paper name** — The name given to a specific paper size. For example, the paper name LETTER usually refers to a sheet of paper with the dimensions 8.5 by 11 inches. See *paper size*.

**paper name table** — An XPAF table, modifiable through XOAF, that assigns paper sizes to paper names. These paper names can be specified with the PAPERSIZ initialization or printer profile parameter or extended JCL keyword, and also correspond to the paper names in the varying paper size tables and cluster mapping tables.

**paper size** — The physical size (in width and height dimensions) of a sheet of paper. See *paper name*.

**paper tray** — The tray from which paper is pulled for printing.

**paper-related table** — A term used to describe the three types of XPAF paper-related tables: paper name table, varying paper size table, and cluster mapping table.

**pass-through processing** — A processing method which allows documents created by Xerox or non-Xerox applications to be passed directly to Xerox printers unaltered. XPAF does not verify the data stream; the data stream is neither conditioned nor converted. A PostScript data stream being printed on a PCL-capable printer is a pass-through data stream.

**PC** — personal computer

**PCL** — Printer Command Language

**PCL-capable printer** — A mid-volume printer that is generally remotely-attached to the host. These printers can print pass-through documents or documents converted to PCL format. The document types that can be printed via pass-through mode depend on the printer command language(s) supported by the printer. PCL-capable printers include these models: 4900, 4700 II, 4230 MRP, 4220 MRP, 4219 MRP, 4215 MRP, 4213 II, 4213 II, Document Centre 265LP, Document Centre 255LP, DocuPrint 4890 NPS, DocuPrint 4850 NPS, DocuPrint 4635 NPS, DocuPrint 4517, DocuPrint 4512, DocuPrint 4508, DocuPrint 4235 LPS, DocuPrint 4090 NPS, DocuPrint 4050 NPS, DocuPrint 180 EPS, DocuPrint 180 NPS, DocuPrint 96 NPS, DocuPrint 92C NPS, DocuPrint 65, DocuPrint C55, DocuPrint N40, DocuPrint N32, DocuPrint N24, DocuTech 6180, DocuTech 6155, DocuTech 6135, DocuTech 6100, Phaser 850DP, and Phaser 750DP.

**PDE** — See *page description entry*.

**PDF** — Program Development Facility

**PDIR** — peripheral device information record

**PDL** — See *print description language*.

**PDL loader** — The XOAF function which loads PDL to a native library and generates a report that consists of the contents of each newly created PDL library member. Access the PDL loader through either the XOAF Load PDL option on the Load Resources menu or the LOAD PDL TSO/batch command.

**PDS** — partitioned dataset

**PDT** — physical device table

**permanent soft fonts** — PCL fonts stored in the printer's memory. Permanent soft fonts remain in memory until the printer's power is turned off, and can be used for more than one document.

**physical page** — The sheet of paper or medium on which you are printing.

**pipeline** — A list of processes (for example, AFP-to-Metacode conversion) required to print a document on an XPAF-connected Xerox printer.

**PJL** — Printer Job Language

**plane** — When one font is split into multiple fonts, these resulting fonts are called planes. Each plane can contain up to 192 printable characters or 64K of raster data. One replica font can be split into a maximum of 16 planes, and one centralized font can be converted into a maximum of 8 decentralized planes.

**PMF** — See *Print Management Facility*.

**POF** — See *printer object file*.

**portrait** — The orientation of print lines or the top of an illustration parallel to the short edge of the paper.

**PPD** — Point Product Driver

**PPFA** — See *Page Printer Formatting Aid*.

**PPT** — Printer Profile Table (Xerox)  
Program Properties Table (IBM)

**presentation** — The orientation in which the page is presented to the printer for printing. See *landscape* and *portrait*.

**print description language (PDL)** — A language used to describe printing jobs to a laser printer. PDL describes the input (type, format, characteristics), performs the processing functions (logical processing), and describes the output (type, format, fonts selection, accounting options). PDL has two valid file formats: JSL files and cataloged member files.

**Print Management Facility (PMF)** — An IBM program that is used to create and modify print resources (for example, page definitions, form definitions, and fonts) used on IBM page printers.

**Print Services Facility (PSF)** — An IBM software product that drives all-points addressable printers.

**printer job language (PJL)** — A facility that allows specification of printer-specific commands that apply to an entire document. For PCL-capable printers only.

**printer object file (POF)** — A file that contains printer resources, such as fonts, forms, images, and logos, used for printing documents.

**printer profile** — A printer- and site-specific file that defines the printing environment to XPAF.

**Program Temporary Fix (PTF)** — A field-tested solution to a specific customer problem or set of problems.

**proportionally spaced font** — A font that contains characters that vary in width.

**PSAF** — Print Services Access Facility

**PSF** — See *Print Services Facility*.

**PTF** — See *Program Temporary Fix*.

**PTX** — presentation text

**PUT** — Program Update Table

**PVT** — Program Vector Table

## R

---

**Raster Encoding Standard (RES)** — A Xerox standard format for color images printed on a highlight color printer

**.RBA** — Relative Byte Address

**RC** — return code

**RECFM** — record format

**relative metrics** — The graphic character measurements expressed as fractions of the square, called the “em-square,” whose sides correspond to the vertical size of the font. These measurements are resolution independent.

**remotely-attached** — A device that is physically connected to a host computer via a telecommunications line.

**replica font** — A Xerox font that is a reproduction of an IBM font.

**report stacking** — The separation of a set of printed output from the previous set.

**RES** — See *Raster Encoding Standard*.

**resolution** — A measure of the sharpness of a resource or a physical printer, expressed as the number of addressable dots or pels per unit of length. For example, dots per inch, pels per centimeter.

**resource** — The fonts, forms, images, or logos that are required, in addition to data, to print a document. A resource can be stored either on the printer, in a library on the host, or inline in the data stream.  
structured field (IBM)

**resource conditioning** — A process performed by XPAF which ensures that all resources required to print a document are available before sending the data stream to the printer.

**RGB** — The red-green-blue color format used by decentralized color printers.

**RJE** — Remote Job Entry

**RPL** — Request Parameter List

**RTEXT** — An RTEXT definition is a set of statements used to define ink catalogs, palettes, and ink lists used in a report. A TST can be a cataloged member, which is one of the valid formats for PDL.

## S

---

**SCSI** — Small Computer System Interface

**SDI** — Shared Disk Interface

**SDLC** — Synchronous Data Link Control

**secondary logical unit (SLU)** — In SNA, the logical unit (LU) that contains the secondary half-session for a particular LU-LU session. An LU may contain secondary and primary half-sessions for different active LU-LU sessions.

**separator page** — See *banner page*.

**separator page first (SEPF)** — A SEPARATORS=FIRST DJDE sent by XPAF in a data stream which signals centralized printers to insert a separator as the first page of each printed output segment using this copy modification.

**SEPF** — See *separator page first*.

**SF** — See *signal function*. (Xerox)  
structured field (IBM)

**short-edge-feed MAP** — (LIB) A set of statements that defines a font substitution list to be used to print a document on large paper that is fed short edge rather than long edge. A LIB can be a cataloged member, which is one of the valid formats for PDL.

**signal function (SF)** — A DJDE sent by XPAF in a data stream which signals centralized printers to communicate with document finishing equipment provided by third-party vendors. XPAF supports signal function 1 and signal function 2 for centralized printers equipped with the Document Finishing Architecture (DFA) interface, version 4.1 or higher. Signal function 1 and signal function 2 are used individually for separate functions in the finishing equipment (for example, signal function 1 can indicate perforate, while signal function 2 can indicate punch). XPAF does not determine the function of each signal; the signal's function is defined by the third-party finishing equipment.

**SIL** — set intensive logging

**simplex** — A page that contains printing on one side of the paper.

**sixelized** — A Xerox encoded data format used for Xerox decentralized fonts and decentralized images.

**SJF** — System JCL Facility

**SLU** — See *secondary logical unit*.

**SMF** — System Management Facilities

**SMP/E** — See *System Modification Program/Extended*

**SMS** — System Managed Storage

**SNA** — System Network Architecture

**sockets** — A method for communication between a client program and a server program in a TCP/IP network. A socket is defined as “the endpoint in a connection.” Sockets are created and used with a set of programming requests or function calls, sometimes called the sockets application programming interface (API).

**SRL** — Service Request List

**SSCT** — Subsystem Communication Control Table

**SSI** — Subsystem Interface

**SSN** — Subsystem Name Table

**STC** — Set Text Color

**STK** — see *stockset*

**stockset** — A set of statements that defines a set of stocks used in a report. An STK can be a cataloged member, which is one of the valid formats for PDL.

**string** — Text, usually with a length restriction, that is enclosed in single quotation marks and is meant to be processed as one entity. It can usually include special characters as well as uppercase alphanumeric characters.

**subpage** — See *line group*.

**substrate** — A physical sheet of paper.

**System Modification Program/ Extended (SMP/E)** — An IBM program product used to install and update software in an z/OS environment.

## T

---

**TCB** — Task Control Block

**TCP** — Transmission Control Protocol

**TCP batch printing** — The batch implementation XPAF uses to support the various third-party TCP stacks. This implementation allows you to customize TCP support for your site.

**TDB** — Table Definition Block

**temporary soft fonts** — PCL fonts stored in the printer's memory which are deleted when the printer is reset, i.e., at the end of the document.

**THM** — Table Handling Mechanism (XPAF component)

**TIC** — Token Ring Interface Coupler

**TIFF** — Tag Image File Format

**TOF** — top of form

**track, track, record (TTR)** — The relative disk address of a member within an IBM PDS or PDS/E library. Each member in a PDS library has a unique TTR associated with it that is stored within the directory entry for that member. For PDS/E datasets, the TTR is a unique token associated with each library member. Whenever a PDS or PDS/E member is updated, the TTR value is also updated.

**transform** — The process in which XPAF converts a print data stream to a different but equivalent format suitable for the destination printer.

**translate table** — A table that translates line-mode character-set values to values that Xerox printers can understand. A translate table maps the character values in the incoming data stream to the proper values of the actual font characters that are available on the printer.

**TRC** — Table Reference Character

**triplet** — A three-part variable length IBM parameter consisting of a length byte, an identifier byte, and one or more parameter value bytes. A structured field may contain one or more triplets.

**TSO** — Terminal Sharing Option

**TST** — see *RTEXT*

**TTR** — See *track, track, record*.

**tumble duplex** — A page that contains printing on both sides of the paper, with the top of the page's front side matched to the bottom of the page's back side.

**two-color RES .IMG** — An image in RES format that contains two colors (black and one other color).

## U

---

**UCS** — Universal Character Set

**UDK** — See *user-defined key*.

**UFL** — Font Loader Utility (XPAF component)

**UFT** — Font Table Utility (XPAF component)

**UIL** — Color Conversion Table Loader (XPAF component)

**UIX** — Color Cross Reference Utility (XPAF component)

**UJL** — PDL Loader (XPAF component)

**ULL** — Logo Loader (XPAF component)

**ULR** — User Library Reload Utility (XPAF component)

**unit base** — The length of the measurement base. This value identifies the unit of length used to express resolution with respect to the total number of addressable dots or pels that are represented by that distance.

**UPL** — Form And Image Loader (XPAF component)

**user exit** — A program developed by the user that acquires control at various points during processing.

**user-defined key (UDK)** — See *Xerox Escape Sequence*.

**usermod** — A system modification that allows you to make changes to certain tables used by XPAF (for example, the JES offset table).

**USS** — Unformatted System Services

**UTB** — Table Creation Utility (XPAF component)

## V

---

**Variable Data Intelligent PostScript PrintWare (VIPP)** — A set of page layout functions bundled as PostScript programs. This provides an easy way to use Xerox PostScript devices in a traditional non-PostScript environment. Output, such as line-mode data produced by traditional applications, can be imaged on a Xerox PostScript printer while requiring few, if any, modifications to the applications that generate the data. For more information, refer to the *Xerox Variable Data Intelligent PostScript PrintWare (VIPP) Reference Manual*.

**varying paper size table** — An XPAF table, modifiable through XOAF, that correlates a physical paper size with an AFP bin number; for use with AFP data streams only.

**VBS** — variable blocked spanned

**VIPP** — see *Variable Data Intelligent PostScript PrintWare*

**VIPP-enabled** — A print device on which VIPP software resides. VIPP documents must be sent to a VIPP-enabled print device.

**VOLSER** — volume serial number

**VSAM** — Virtual Sequential Access Method

**VTAM** — Virtual Telecommunications Access Method

## W

---

**WTO** — write to operator

## X

---

**XAE** — XNS Environmental Envelope (XPAF component)

**XAM** — AFP To Metacode Transform (XPAF component)

**XAU** — AFP To XES Transform (XPAF component)

**XCC** — Centralized Printer Resource Conditioner (XPAF component)

**XCD** — DJDE to XES Transform (XPAF component)

**XCN** — Font Metrics Converter (XPAF component)

**XCO** — Xerox Coax Option

**XCTO** — Xerox Coax/Twinax Option

**XDDI** — Xerox Dynamic Document Interface

**XDI** — Distributor (XPAF component)

**XDPM** — See *Xerox Distributed Print Mode*.

**XDS** — Xerox Direct Print Services (XPAF component)

**XEI** — Environmental Intermedium (XPAF component)

**Xerox Distributed Print Mode (XDPM)** — A Xerox term that describes printing in a decentralized environment.

**Xerox Escape Sequence (XES)** — A user-defined character used in control code sequences sent to decentralized printers. Also known as user-defined key.

**Xerox font information table (XPAFXFI)** — A table containing information about Xerox fonts (for example, typeface, weight, width, point size, and print direction) and referenced by either the XOAF Convert Xerox Fonts to IBM Format option or the Load Font TSO/batch command, which makes Xerox fonts available to IBM's DCF product.

**Xerox Job Control Facility (XJCF)** — The program which modifies data streams in order to format printouts to user specifications using standard IBM JCL keywords. You may run XPAF in addition to XJCF (coexistence mode) or instead of XJCF (simulation mode).

**Xerox Network Services (XNS)** — A protocol that consists of a variety of digital processors interconnected by means of a variety of transmission media. This protocol is used by XPAF for communicating print requests from a client to a print service.

**Xerox Output Administrative Facility (XOAF)** — The XPAF subsystem used to manage the resources (for example, fonts, forms, images) required to print documents.

**Xerox Output Services Facility (XOSF)** — The XPAF subsystem that interfaces with z/OS to accept documents from JES, transform them into a format suitable for the intended printer, and transmit them to the printer.

**Xerox Printer Access Facility (XPAF)** — A host-resident software product that enhances the capabilities and use of Xerox laser printers in an IBM z/OS environment.

**Xerox Printing Services Client (XPSC-z/OS)** — An z/OS host-based software product that provides two-way communications between the host mainframe and an XPSM server using LU 6.2 communication protocol.

**Xerox Printing Services Manager for the IBM RS/6000 (XPSM)** — IBM RS/6000 resident software that communicates with clients to accept jobs for printing. This XPSM server software transmits the jobs to printers under its control.

**Xerox Production Print Mode (XPPM)** — A Xerox term that describes printing in a centralized environment.

**XES** — See *Xerox Escape Sequence*.

**XFC** — Xerox Font Converter (XPAF component)

**XFDB** — Xerox Fragment Descriptor Block

**XFI** — Xerox Font Information

**XFS** — FSA Solicitor Prefix (XPAF component)

**XFU** — Form Converter (XPAF component)

**XIN** — Initialization (XPAF component)

**XIS** — Image To Sixel Converter (XPAF component)

**XJC** — JCL To DJDE Transform (XPAF component)

**XJCF** — See *Xerox Job Control Facility*.

**XJCFSIM tables** — The tables used by XPAF in XJCF simulation mode to simulate the XJCF program.

**XJCL** — Extended Job Control Language

**XJS** — PDL Processor (XPAF component)

**XLC** — Logo Converter (XPAF component)

**XLD** — LDM Utility (XPAF component)

**XLOG** — A dataset that is used for recording messages issued by XPAF.

**XLW** — Local Writer (XPAF component)

**XMS** — Xerographic mode switching

**XNS** — See *Xerox Network Services*.

**XOA** — XOAF Superstructure (XPAF component)

**XOAF** — See *Xerox Output Administrative Facility*.

**XOAPRMS** — XOAF parameters

**XOSF** — See *Xerox Output Services Facility*.

**XPA** — Common Parsing Routines (XPAF component)

**XPAF** — See *Xerox Printer Access Facility*.

**XPAF extended JCL** — A set of JCL keywords that are unique to XPAF.

**XPAF full-client mode** — A mode providing all XPAF functions to XPSM that are relevant to these centralized printers: 4890, 4850, 4635MX, 4635, 4135, 4090, or 4050. This mode enables you to print line-mode, DJDE, page-formatted, and AFP data streams.

**XPAF-internal format** — A file format, specific to XPAF, that is used when storing AFP overlays that have been converted to forms in the decentralized form library. At print time, forms that are in XPAF-internal format are converted to XES format before being downloaded to the printer.

**XPAF-started identifier** — The DJDE identifier in the JDE/JDL that is named by any of these parameters:

- JDE printer profile parameter
- JDL printer profile parameter
- DEFJDE initialization parameter
- DEFJDL initialization parameter

**XPAFA2A** — See *ASCII-to-ASCII table*.

**XPAFAFW** — See *ASCII font widths table*.

**XPAFCFN** — See *coded font name table*.

**XPAFE2A** — See *EBCDIC-to-ASCII table*.

**XPAFEFW** — See *EBCDIC font widths table*.

**XPAFFFI** — See *font family information table*.

**XPAFI2I** — See *IBM-to-IBM table*.

**XPAFI2X** — See *IBM-to-Xerox table*.

**XPAFIFW** — See *IBM font widths table*.

**XPAFXFI** — See *Xerox font information table*.

**XPC** — Xerox Printing Control Language (XPAF component)

**XPCL** — Xerox Printing Control Language (XPAF component)

**XPFE** — Xerox Page Format Editor (XPAF component)

**XPFSAMP** — The default sample source library for XPAF.

**XPL** — Pipeline (XPAF component)

**XPPM** — See *Xerox Production Print Mode*.

**XPS** — Xerox Print Services (XPAF component)

**XPSC-compatibility mode** — A mode providing all XPSC-z/OS 1.1 functions in XPAF to XPSM that are relevant to these centralized printers: 4890, 4850, 4635MX, 4635, 4135, 4090, or 4050. This mode enables you to print line-mode and DJDE data streams.

**XPSC-z/OS** — See *Xerox Printing Services Client*.

**XPSM** — See *Xerox Printing Services Manager for the IBM RS/6000*.

**XRC** — Centralized Image Transform (XPAF component)

**XRD** — Decentralized Image Transform (XPAF component)

**XRF** — AFP Resource Transform (XPAF component)

**XSJ** — JCL Keyword Processor (XPAF component)

**XSL** — Solicitor Nucleus (XPAF component)

**XSTCB** — Xerox Subtask Control Block

**XTB** — Printer Table Initialization/Termination (XPAF component)

## Z

libraries, see individual library type

## LIBRARY

- printer profile parameter, 6-18, 11-2, 19-24, 23-2, 23-9, 23-14, 23-20, 41-57, 44-6, C-9

- LIBRARY DELETE TSO/batch command, 21-22, 27-6

- LIBRARY DIRECTORY TSO/batch command, 21-22, 27-3

- LIBRARY DISPLAY TSO/batch command, 27-5

## licensed fonts

- alternate naming for, 24-18
- definition of, 19-4
- limitations, 19-4

- Limitation, 31-11

## LINE

- (CME statement), 33-19

## line count, 56-7

- maximum number on output page, specifying, 42-11
- number from top of page to bottom of form, specifying, 43-5
- top of page for overflow condition, specifying, 43-59

## line data parameters for page layouts

- copying, 52-4
- specifying, 56-6, 56-10

## line groups

- color selection, 56-9
- conditional processing, activating, 56-9
- creating, 56-6
- current line, repeating, 56-6
- definition of, 51-6
- deleting, 56-6
- editing, 56-6
- field formats, specifying, 56-9
- fonts, specifying, 56-8
- inserting, 56-6
- line count, specifying, 56-7
- line position for, starting, 56-7
- line spacing, specifying, 56-7
- positioning on logical page, 56-7

- Line Printer Daemon, see *LPD print server*

## line spacing

- for field formats, 56-11
- for line groups, 56-7
- for page layouts, 56-5
- overrides, 56-7, 56-11
- specifying, 42-5

## LINE statement

- DATA command, 33-21
- FONTINDEX command, 33-21
- INKINDEX command, 33-13, 33-21
- MARGIN command, 33-21
- OVERPRINT command, 33-21

- VFU command, 33-21

## line-mode data streams, 32-1, 32-4

- advanced features, 32-2
- definition of, 32-1, 37-1
- parameter/keyword processing hierarchy for, 40-3, 41-3, 43-2
- printer types supported, 32-1, 37-1
- printing, 32-2, 37-2
- processing, 1-13, 32-1, 37-1
  - as AFP document, 32-3
  - as DJDE document, 32-3
- resource requirements, 32-1
- troubleshooting, 32-4

## LINECT

- IBM JCL keyword, 42-11, 44-6

## LINED library, 53-1, 53-2, 56-2, 58-1

## LINENUM

- (CRITERIA statement), 33-19

- Link Pack Area, see *LPA*

- LNC structured field, 36-16

- LND structured field, 36-16

## LOAD FONT TSO/batch command

- for centralized fonts, 20-22, 21-4, 22-4, 22-34, 25-1

- for custom replica fonts, 20-28, 25-6, 25-13, 25-35

- for decentralized fonts, 20-22, 21-12, 25-1

## LOAD FORM TSO/batch command

- for centralized forms, 21-6

- for decentralized forms, 21-14

## LOAD IMAGE TSO/batch command

- for centralized images, 21-8

- for decentralized images, 21-16

## LOAD INKS TSO/batch command, 20-34, 24-52, 24-53, 33-11

## LOAD LOGO TSO/batch command, 21-10

## LOAD PDL TSO/batch command, 19-32, 21-18

- Load Resources menu option, 18-9, 21-1

- local printers, defining, 5-7

- logging, see *z/OS system logging* and *XPAF system logging*

- logical device table, updating for DCF/SCRIPT, 6-20, 6-22, 19-5, 36-4, 36-18

## logical page

- dimensions, 43-4, 51-5
- offset, 55-4
- origin, 51-2, 51-5
- positioning, 43-56
- print direction, 56-12
- size in page layouts, defining, 56-5

## logo library

- specifying, 19-18, 21-9, 40-15, 41-57, C-8
- specifying size of, 4-10

## logo lists

- adding entry to, 23-24
    - creating, 23-21, 23-22, 33-5, 35-4
    - deleting, 23-22
    - deleting entry from, 23-25
    - library, specifying, 41-57
    - managing, 23-20, 23-25
