1 Introduction

The Account Management Tool provides a central point to administer accounts and users and track print, copy and scan usage for several Accxes based printers. The Account Management Tool application runs on a Windows PC, or a Solaris workstation.

Beginning with Accxes firmware version 7.5, the media usage (job accounting) of multiple printers is tracked through the Account Management Tool (AMT), or some other external accounting server. This replaces the functionality of the Accxes Client Tools (ACT) Accounting Tab, which becomes disabled when ACT is communicating with a printer that is using Accxes firmware version 7.0, or greater.

WARNING: It is critical to first save media usage data from the printers' controllers before loading version 7.0 or greater Accxes firmware, or the data will be lost.

The pre 7.0 Accxes firmware accounting data can be saved by using one of the following techniques: the pre-7.0 Web PMT Accounting page, the Accxes Client Tools' Accounting Tab, the individual DST that existed prior to the Accxes Client Tools or the data can be saved to a floppy disk. See Appendix 1 in the [Accxes Account Management Tool Administrator's Guide](#) for details.

1.1 How the AMT Works

Read the Overview and try the Tutorial in the AMT help files in the Accxes Account Management Tool Administrator's Guide.

1.2 Installing AMT

It is recommended that the AMT should be installed on only one workstation. Both the Accxes Client Tools and the Account Management Tool can be installed during the same installation process. A password is needed for installing AMT. If a password is not entered on the "Enter Password" screen, the "NEXT" button is pressed to continue with installing only the Accxes Client Tools. See the Read Me file, or the [Accxes Account Management Tool Administrator's Guide](#) for installation details.

NOTES:

- Because of the additional media types, AMT 12.1 cannot load the version 8.0 TALLY tables. The tallied database can be regenerated from the Raw Job Accounting Database. However, if you want to preserve your current Tallied Database, you must save it to disk (with a unique file name) before installing AMT 12.1.

- If you want to install another language version of the ACT- AMT application to the same directory, you must first uninstall the existing ACT- AMT application.

1.3 Uninstalling AMT

Both AMT and ACT are uninstalled at the same time if they reside on the same workstation. In Windows, they are removed by selecting “Accxes” on the Add/Remove Program Properties screen. In UNIX, they are removed in the Accxes/UninstallerData directory. To preserve your current AMT raw job accounting database, the data files will remain in the AMT database folder after uninstalling. This database folder will be listed on the Uninstall Complete screen. The .lib and .bin files that also appear on the Uninstall Complete screen are erroneously listed. This is because they have already been deleted in a previous step of the Uninstall. See the [Accxes Account Management Tool Administrator’s Guide](#) for details on uninstalling AMT.

2 What's new in 12.1 AMT

2.1 Enhancements

- New, faster Java Virtual Machine.
- Compatibility with Windows 2003 Server.
- Compatibility with Windows Vista.
- Compatibility with Solaris 10.
- Compatibility with MacOS X 10.4.
- Russian language support.

3 Release Notes

3.1 Memory Requirements for Global Associations

The maximum number of AMT records allowed is: 9999 accounts, 9999 users, 999 printers, and 12,000 associations. An association is a combination of an account, a user, and a printer.

NOTE: If you are running AMT under Microsoft Windows and you plan to utilize the maximum number of associations, you must set the virtual memory on your system to a starting minimum value of 300 MB.

If AMT is going to reach its associations limit, a popup message will warn you that the associations cannot be created. You could then delete unused or obsolete accounts, users, or printers in the database to reduce the number of associations as well as the associations themselves. When an account, user or printer is deleted, any associations that reference that account/user/printer are deleted.

AMT on Mac OS X: When using this combination it is recommended that you have a minimum of a G4 processor with OS X 10.4 or greater and Java 1.5 or greater. OS X 10.4 and Java updates are available via Apple's Software Update.

3.2 Printers Tab – Purge Needed Checkbox

If you press the button on the Printers Tab to resend the “purge” command to the printer, the checkbox may remain in the Purge needed column, if so, select View > Printers to reset the checkbox to be blank, which indicates that the data was successfully purged in the printer's controller job log file.

3.3 Tallied Data

- Using 256 MB of memory, tallying the database could take up to 1 hour if there are 10,000 associations.
- Because of the additional media types, AMT 12.1 cannot load the 8.0 version's TALLY tables. The tallied database can be regenerated from the Raw Job Accounting Database. However, if you want to preserve your current Tallied Database, you must save it to disk (with a unique file name) before installing AMT 12.1.
- For certain large databases, the Generic Account does not get sorted correctly and ends up in the middle. The rows above and below the Generic Account row are sorted correctly.

3.4 Saving Data to a Disk

When the tally or raw data is written to disk, if a file of the same name already exists an alert pops-up and says: "Do you want to replace existing file?" Instead of replacing the file, it appends to the existing file. Give each file a unique name to avoid this.

3.5 One Location for AMT

It is best to use just one AMT application, from one machine. If you try to run more than one AMT application at the same time, from the same machine, both applications will lock up. If AMT is loaded on more than one machine, then you risk losing data if you interact with the same printer from the multiple AMT locations.

3.6 Data Corruption

It is important to do a manual backup of the AMT database files on a regular basis. The names of the AMT database files are: AccXESjadb.backup, AccXESjadb.data, AccXESjadb.script, AccXESjadb.properties. In the Windows environment, the default location of these data files is C:\ Program Files \AccXES\ AMTdatabase. If you accidentally corrupt or delete the saved AMT data files, they cannot be recovered. Your manually backed up files would then need to be copied into the AMT database folder.

3.7 Importing data

Pre 7.5 Accxes generated data:

- The import data file must be a .txt file.
- Scan to net area Legacy accounting data cannot be imported. This is because it is in square area that was scanned (dm), while the new job based accounting displays scan to net data by file size (KB).
- When importing Legacy accounting data, all printer names will be listed as UNKNOWN.

3.8 Non-Accxes Controller generated data:

AMT will only import an ASCII text format file containing account and sub-account/user identifiers, no binary code, and no control characters except CRLF (Carriage Return Line Feed). See the Import section of the user guides for details of the acceptable format within the ASCII file.

NOTE: In AMT 8.0, if account or sub-account identifiers were greater than 32 characters, the first 32 were imported. Beginning with 9.0, these identifiers will not be imported at all. They will be reported as errors.

3.9 Data values

If "metric units" is selected as the Display Units on the Job Accounting Options dialog, the raw database units are square mm and become square dm in the tallied database. If "English units" is selected, the raw database units are square inches and the tallied data is in square feet.

In the raw database, which shows on the Printer Job Accounting Tab, if multiple media sizes, or media types, are used for the same print job, the data for only one will show in the Media Type column cell. It is the first value read from the Accxes controller's job log file. The AMT has no control over the order in which the Accxes populates the job log file. However, you can double click on the Media Type table cell to reveal the data values for all of the media types that were used in the same print job.

3.10 Exporting Data

After exporting the raw or tallied data, the same data will be exported during the next export of data, if the records are not first deleted from the databases, via the Printer Job Accounting Tab. You should also export data before the Raw Job Accounting Database's keep interval (default 30 days) is reached, which will cause the raw database records to be deleted the next time that you retrieve data from the printers' controllers.

3.11 Data Records Retrieved from Deleted UserIDs or AccountIDs

It is recommended that the AMT Administrator retrieve the printer controller's job log file data first before deleting users or accounts in the AMT. If not, the existing job log file data will still be copied to the AMT Raw Job Accounting the next time that you retrieve data from the controllers.

3.12 Displayed Records Disappear

When displaying the database records, either raw or tallied, they will seem to disappear if the 'Job Accounting Options' dialogue is opened.

To re-display the records simply press either the 'view' or 'view tallied' button.

3.13 Windows Vista

By default, Windows Vista virtualizes all attempts to write in "C:\Program Files\AccXES\" to "C:\Users\<CurrentUser>\AppData\Local\VirtualStore\Program Files\AccXES\".

It is possible to access these files without changing any settings by simply typing the location in to the Windows Explorer location bar. The "AppData" folder is a hidden folder, so it can not be browsed to by clicking through with the mouse unless Hidden Files and Folders are shown.

This is a new security policy in Windows Vista that falls under User Accounts Control (UAC). The security policy can be found and modified at:

Control Panel->Administrative Tools->Local Security Policy->Local Policies->Security Options->

The two Security Policies that need to be changed are:

User Account Control: Run all administrators in Admin Approval Mode

User Account Control: Virtualized file and registry write failures to per-user locations

If both of these policies are set to disabled before AMT is installed for the first time, then the database files will be written to the normal location at C:\Program Files\AccXES\AMTdatabase. (The system MUST be restarted before changes to these policies will take effect)

To switch to this behavior after AMT has been installed and used, you will need to back up the database files then completely remove AMT. Next, change the security policies, and reboot the system. You can then install AMT, and copy your database files to the normal location.

3.14 Miscellaneous

- If you want to install another language version of the ACT- AMT application to the same directory, you must first uninstall the existing ACT- AMT application.
- When a user specifies that a job be folded, the job is logged as "Folded" even if the fold job does not complete the fold process
